ABSTRACT

We prove a common fixed point theorem in the context of fuzzy metric spaces with integral type for contraction mapping.

Keywords: Contractive Condition, Intuitionistic Fuzzy Metric Space, Common Fixed Point Theorem.

1. INTRODUCTION

El Naschie was motivated by the potential applicability of fuzzy topology to quantum particle physics particularly in connection with both string and $e^{(s)}$. Park introduced and discussed in [21] a notion of intuitionistic fuzzy metric spaces which is based on the idea of intuitionistic fuzzy sets due to Atanassov [2] and the concept of fuzzy metric space given by George and Veeramani [11]. Actually, Park's notion is useful in modelling some phenomena where it is necessary to study the relationship between two probability functions.

Alaca et al. [1] using the idea of intuitionistic fuzzy sets, they defined the notion of intuitionistic fuzzy metric space as Park [21] with the help of continuous t-norms and continuous t-conorms as a generalization of fuzzy metric space due to Kramosil and Michalek [15]. Further, they introduced the notion of Cauchy sequences in intuitionistic fuzzy metric spaces and proved the well known fixed point theorems of Banach [3] and Edelstein [5] extended to intuitionistic fuzzy metric spaces with the help of Grabiec [10]. Turkoglu et al. [25] introduced the concept of compatible maps and compatible maps of types (α) and (β) in intuitionistic fuzzy metric spaces and gave some relations between the concepts of compatible maps and compatible maps of types (α) and (β). Sharma and Tilwankar [24] and Kutukcu [18] proved fixed point theorems for multivalued mappings in intuitionistic fuzzy metric spaces.

Several authors [12], [13], [15], [23] proved some fixed point theorems for various generalizations of contraction mappings in probabilistic and fuzzy metric space. Branciari [4] obtained a fixed point theorem for a single mapping satisfying an analogue of Banach's contraction principle for an integral type inequality. Sedghi et al. [22] established a common fixed point theorem for weakly compatible mappings in intuitionistic fuzzy metric space satisfying a contractive condition of integral type. Muralisankar et al. [20] proved a common fixed point theorem in an intuitionistic fuzzy metric space for pointwise R-weakly commuting mappings using contractive condition of integral type and established a situation in which a collection of maps has a fixed point which is a point of discontinuity.

2. PRELIMINARIES

Definition: 2.1 ([23]) A binary operation $*: [0; 1] \times [0, 1] \rightarrow [0, 1]$ is continuous t-norm if $*$ is satisfying the following conditions:
(i) $*$ is commutative and associative,
(ii) $*$ is continuous,
(iii) $a * 1 = a$ for all $a \in [0, 1]$,
(iv) $a * b \leq c * d$ whenever $a \leq c$ and $b \leq d$, $a, b, c, d \in [0, 1]$.

Corresponding author: Ch. Shashi Kumar*1, E-mail: skch17@gmail.com
Definition: 2.2 ([23]) A binary operation $*: [0, 1] \times [0, 1] \rightarrow [0, 1]$ is continuous t-conorm if $\circ$ is satisfying the following conditions:
(i) $\circ$ is commutative and associative,
(ii) $\circ$ is continuous,
(iii) $a \circ 0 = a$ for all $a \in [0, 1]$,
(iv) $a \circ b \leq c \circ d$ whenever $a \leq c$ and $b \leq d$, $a, b, c, d \in [0, 1]$.

Definition: 2.3 ([1]) A 5-tuple $(X, M, N, *, \circ)$ is said to be an intuitionistic fuzzy metric spaces if $X$ is an arbitrary set, $*$ is a continuous t-norm, $\circ$ is a continuous t-conorm and $M, N$ are fuzzy sets on $X \times [0, 1]$ satisfying the following conditions for all $x, y, z \in X$ and $t, s > 0$,
(i) $M(x, y, t) + N(x, y, t) \leq 1$,
(ii) $M(x, y, 0) = 0$,
(iii) $M(x, y, t) = 1$ for all $t > 0$ if and only if $x = y$,
(iv) $M(x, y, t) = M(x, x, t)$,
(v) $M(x, y, t) \circ M(y, z, s) \leq M(x, z, t + s)$,
(vi) $\lim_{t \to \infty} M(x, y, t) = 1$ for all $x, y \in X$,
(vii) $\lim_{t \to \infty} M(x, y, t) = 1$ for all $x, y \in X$,
(viii) $N(x, y, 0) = 1$,
(ix) $N(x, y, t) = 0$ for all $t > 0$ if and only if $x = y$,
(x) $N(x, y, t) = N(x, y, t)$,
(xi) $N(x, y, t) \circ N(y, z, s) \geq N(x, z, t + s)$,
(xii) $\lim_{t \to \infty} N(x, y, t) = 0$ for all $x, y \in X$.

Then $(M, N)$ is called an intuitionistic fuzzy metric on $X$. The functions $M(x, y; t)$ and $N(x, y; t)$ denote the degree of nearness and the degree of non-nearness between $x$ and $y$ with respect to $t$, respectively.

Remark: 1 Every fuzzy metric space $(X, M, *)$ is an intuitionistic fuzzy metric space of the form $(X, M, 1-M, *, \circ)$ such that t-norm $*$ and t-conorm $\circ$ are associated, i.e., $x \circ y = 1 - ((1-x) \ast (1-y))$ for all $x, y \in X$.

Example: 1 Let $(X, d)$ be a metric space. Define t-norm $a \ast b = \min \{a, b\}$ and t-conorm $a \circ b = \max \{a, b\}$ and for all $x, y \in X$ and $t > 0$,
$$M_d(x, y, t) = \frac{t}{t + d(x, y)}, N_d(x, y, t) = \frac{d(x, y)}{t + d(x, y)}.$$ Then $(X, M, N, *, \circ)$ is an intuitionistic fuzzy metric space. We call this intuitionistic fuzzy metric $(M, N)$ induced by the metric $d$ the standard intuitionistic fuzzy metric. On the other hand, note that there exists no metric on $X$ satisfying (2a).

Remark: 2 In intuitionistic fuzzy metric space $(X, M, N, \circ)$, $M(x, y, \cdot)$ is non-decreasing and $N(x, y, \cdot)$ is non-increasing for all $x, y \in X$.

Definition: 2.4 ([1]) Let $(X, M, N, *, \circ)$ be an intuitionistic fuzzy metric space. Then
(i) A sequence $\{x_n\}$ in $X$ is said to be convergent to a point $x \in X$ (denoted by $\lim_{n \to \infty} x_n = x$) if, for all $t > 0$,
$$\lim_{n \to \infty} M(x_n, x, t) = 1, \lim_{n \to \infty} N(x_n, x, t) = 0$$
(ii) A sequence $\{x_n\}$ in $X$ is said to be Cauchy sequence if, for all $t > 0$ and $p > 0$,
$$\lim_{n \to \infty} M(x_{n+p}, x_n, t) = 1, \lim_{n \to \infty} N(x_{n+p}, x_n, t) = 0$$
Remark: 3 Since $*$ and $\circ$ are continuous, the limit is uniquely determined from (v) and (xi), respectively.

Definition: 2.5 ([1]) An intuitionistic fuzzy metric space $(X, M, N, \circ)$ is said to be complete if and only if every Cauchy sequence in $X$ is convergent.

Lemma: 1 ([1]) Let $(X, M, N, \circ)$ be an intuitionistic fuzzy metric space and $\{y_n\}$ be sequence in $X$. If there exists a number $k \in (0, 1)$ such that
$$M(y_{n+2}, y_{n+1}, kt) \geq M(y_{n+1}, y_n, t), N(y_{n+2}, y_{n+1}, kt) \leq N(y_{n+1}, y_n, t)$$ for all $t > 0$ and $n = 1, 2, \ldots$, then $\{y_n\}$ is a Cauchy sequence in $X$. 

© 2014, IJMA. All Rights Reserved
Lemma: 2 ([1]) Let \((X, M, N, *, \Join)\) be an intuitionistic fuzzy metric space and for all \(x, y \in X, t > 0\) and if for a number \(k \in (0, 1)\),
\[ M(x, y, kt) \geq M(x, y, t) \] and \(N(x, y, kt) \leq N(x, y, t)\),
then \(x = y\).

Definition: 6 ([14]) Two self mappings \(S\) and \(T\) are said to be weakly compatible if they commute at their coincidence points; i.e., if \(T u = Su\) for some \(u \in X\), then \(T Su = ST u\).

3. MAIN RESULTS

Theorem: 3. 1 Let \((X, M, N, *, \Join)\) be an Intuitionistic Fuzzy Metric Space with continuous \(t\)-norm \(*\) and continuous \(t\)-conorm \(\Join\) defined by \(t * t \geq t\) and \((1 - t) \Join (1 - t) \leq (1 - t)\) for all \(t \in [0, 1]\). Let \(A, B, S, T, P\) and \(Q\) be mapping from \(X\) into itself such that
(a) \(P(X) \subseteq ST(X)\) and \(Q(X) \subseteq AB(X)\)
(b) There exists a constant \(k \in (0, 1)\) such that
\[
\int_0^t [M(Pu, Qv, (kx))]^2 \phi(t) dt \geq \int_0^t [M(u, v, x)]^2 \phi(t) dt \text{ and}
\int_0^t [N(Pu, Qv, (kx))]^2 \phi(t) dt \leq \int_0^t [N(u, v, x)]^2 \phi(t) dt
\]
where \(\phi: R^+ \rightarrow R^+\) is a Lebesque – Integrable mapping which is summable non-negative and such that
\[
\int_0^\infty \phi(t) dt > 0 \text{ for each } \varepsilon > 0.
\]
for \(u, v \in X\) and \(x \geq 0\) and
(c) If one of \(P(x)\), \(AB(x)\), \(ST(x)\) or \(Q(x)\) is a complete subspace of \(X\). Then
(i) \(P\) and \(AB\) have a coincidence point and (ii) \(Q\) and \(ST\) have coincidence point

The paid \{\(P, AB\)\} is weakly compatible.
(d) \(AB = BA\), \(QB = BQ\), \(QA = AQ\), \(PT = TP\), \(ST = TS\) and
(e) The paid \{\(P, ST\)\} is weakly compatible

Then
\(A, B, S, T, P\) and \(Q\) have a unique common fixed point in \(X\).

Proof: For any point \(x_0\) in \(X\), there exists a point \(x_1 \in X\), such that \(P x_0 = ST x_1\). For this point \(x_1\), we can choose a point \(x_2\) in \(X\), such that \(Q x_1 = AB x_2\) and so on, in this manner we can define a sequence \(\{y_n\}\) in \(X\) such that
\[
y_{2n} = P x_{2n} = T x_{2n+1} \text{ and } y_{2n+1} = Q x_{2n+1} = A x_{2n+2}, \text{ for } n = 0, 1, 2, \ldots
\]
Now we shall prove \(F y_{2n}, y_{2n+1}(kx) \geq F y_{2n-1}, y_{2n}(x)\) for all \(x > 0\), where \(k \in (0, 1)\). Suppose that \(F y_{2n}, y_{2n+1}(kx) < F y_{2n-1}, y_{2n}(x)\). \(F y_{2n}, y_{2n+1}(kx) \leq F y_{2n}, y_{2n+1}(x)\), we have

\[
m(u, v, t) = \min [M(Pu, Qv, (kx))]^2 \phi(t) dt
\geq \min [M(u, v, x)]^2 \phi(t) dt
\]
\[
\int_0^t [M(Pu, Qv, (kx))]^2 \phi(t) dt \geq \int_0^t [M(u, v, x)]^2 \phi(t) dt
\]
\[
\int_0^t [N(Pu, Qv, (kx))]^2 \phi(t) dt \leq \int_0^t [N(u, v, x)]^2 \phi(t) dt
\]
\[
\int_0^t [M(Pu, Qv, (kx))]^2 \phi(t) dt \geq \int_0^t [M(u, v, x)]^2 \phi(t) dt
\]
\[
\int_0^t [N(Pu, Qv, (kx))]^2 \phi(t) dt \leq \int_0^t [N(u, v, x)]^2 \phi(t) dt
\]
\[
\int_0^t [M(Pu, Qv, (kx))]^2 \phi(t) dt \geq \int_0^t [M(u, v, x)]^2 \phi(t) dt
\]
\[
\int_0^t [N(Pu, Qv, (kx))]^2 \phi(t) dt \leq \int_0^t [N(u, v, x)]^2 \phi(t) dt
\]

\[ n(u, v, t) = \max_0 \int_0^{[M_{P_{x_{2n}}, Q_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ \leq \max_0 \int_0^{[N_{P_{x_{2n}}, Q_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ \int_0^{[M_{P_{x_{2n}}, Q_{x_{2n+1}}(x)}]^{2}} \phi(t)dt = \int_0^{[M_{Q_{x_{2n}}, P_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ \geq \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt \]

1(a)

\[ \int_0^{[N_{P_{x_{2n}}, Q_{x_{2n+1}}(x)}]^{2}} \phi(t)dt = \int_0^{[N_{Q_{x_{2n}}, P_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ \leq \int_0^{[N_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt \]

1(b)

\[ [M(x_{2n+1}, x_{2n}(x))]^{2} = \max_0 \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt \]

\[ = \int_0^{[M_{P_{x_{2n}}, Q_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ = \int_0^{[M_{Q_{x_{2n}}, P_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ \geq \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt \]

\[ [N(x_{2n+1}, x_{2n}(x))]^{2} = \max_0 \int_0^{[N_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt \]

\[ = \int_0^{[N_{P_{x_{2n}}, Q_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ = \int_0^{[N_{Q_{x_{2n}}, P_{x_{2n+1}}(x)}]^{2}} \phi(t)dt \]

\[ \leq \int_0^{[N_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt \]

\[ \geq \min_0 \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt, \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt, \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt, \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt, \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt, \int_0^{[M_{y_{2n+1}, y_{2n}}(x)]^{2}} \phi(t)dt, \]

© 2014, IJMA. All Rights Reserved
which is a contradiction. Thus we have

\[ \int_0^1 \phi(t) dt \geq \int_0^1 \phi(t) dt \]

and

\[ \int_0^1 \phi(t) dt \leq \int_0^1 \phi(t) dt \]

Similarly we have

\[ \int_0^1 \phi(t) dt \geq \int_0^1 \phi(t) dt \]

and

\[ \int_0^1 \phi(t) dt \leq \int_0^1 \phi(t) dt \]

\{y_n\} is a Cauchy sequence in X. Since \{y_n\} converges to a point z in X, and the subsequences \{P_{x_2n}\}, \{Q_{x_2n+1}\}, \{A_{x_2n}\} and \{ST_{x_2n+1}\} of \{y_{2n}\} also converges to z.

Now suppose that P is continuous, since P and AB are weak compatible of type (α), it follows from

\[(AB)P_{x_2n} \to Pz \quad \text{and} \quad PP_{x_2n} \to Pz \quad \text{as} \quad n \to \infty.\]

Now putting \(u = P_{x_2n}\) and \(v = x_{2n+1}\) in the given equation, we have

\[ \int_0^1 \left[ M(PP_{x_2n}, P_{x_2n} (x_{2n+1}(x))) \right]^2 \phi(t) dt \]

\[ \geq \min \left\{ \int_0^1 \left[ M(y_2n, y_{2n+1}(x)) \right]^2 \phi(t) dt, \int_0^1 \left[ M(y_2n, y_{2n+1}(x)) \right]^2 \phi(t) dt \right\} \]

\[ = \left\{ \int_0^1 \left[ M(y_2n, y_{2n+1}(x)) \right]^2 \phi(t) dt \right\} \]

which is a contradiction. Thus we have
Taking the limit $n \to \infty$, we have

$$\int_0^{[NPPz_n, Qz_{2n+1}(k)]^2} \phi(t) \, dt \leq \max \int_0^{[N(A)Pz_n, Qz_{2n+1}(k)]^2} \phi(t) \, dt$$

$$\int_0^{[NPPz_n, Qz_{2n+1}(k)]^2} \phi(t) \, dt \leq \min \int_0^{[N(A)Pz_n, Qz_{2n+1}(k)]^2} \phi(t) \, dt$$

$$\int_0^{[NPPz_n, Qz_{2n+1}(k)]^2} \phi(t) \, dt \leq \max \int_0^{[N(A)Pz_n, Qz_{2n+1}(k)]^2} \phi(t) \, dt$$

which is a contradiction. Thus we have $Pz = z$. Since $P(X) \subseteq ST(X)$, there exists a point $u \in X$ such that $z = Pz = Tp$. Again putting $u = Px_2n$ and $v = p$ in, given equation

$$\int_0^{[MPPz_n, Qpk_k]^{2n+1}} \phi(t) \, dt \geq \min \int_0^{[M(A)Pz_n, Tpk_k]^{2n+1}} \phi(t) \, dt$$
Taking the limit $n \to \infty$, we have
\[
\int_{0}^{[Mz, Qp(kx)]^2} \phi(t) dt \leq \max \int_{0}^{[Nz, Qp(kx)]^2} \phi(t) dt
\]
which is a contradiction, therefore $z = Qp$. Since $Q$ and $T$ are weak compatible of type (a) and $Tp = Qp = z$, $(T)Qp = Q(T)p$ and hence $STz = (T)Qp = Q(T)p = Qz$. Again by putting $u = x_{2n}$ and $v = z$ in we have
\[
\int_{0}^{[Mz, Qp(kx)]^2} \phi(t) dt \geq \min \int_{0}^{[Nx, Tz(x)]^2} \phi(t) dt
\]

\[
\int_{0}^{[Nz, Qp(kx)]^2} \phi(t) dt \leq \max \int_{0}^{[Nz, Qp(kx)]^2} \phi(t) dt
\]
Letting \( n \to \infty \), we have
\[
\int_0^{[M;Q(z)]^2} \phi(t) \, dt \geq \int_0^{[M;Q(z)]^2} \phi(t) \, dt \quad \text{and} \quad \int_0^{[N;Q(z)]^2} \phi(t) \, dt \leq \int_0^{[N;Q(z)]^2} \phi(t) \, dt
\]
which is a contradiction, therefore we have \( Qz = z \). Thus \( Qz = STz = z \). Similarly since \( P \) and \( AB \) are weak compatible of type (a), we have \( ABz = Pz = z \). Now we prove \( Az = z \). Suppose that \( Az \) then by putting \( u = Az \) and \( v = z \) in given equation
\[
\int_0^{[M;P;Q(z)]^2} \phi(t) \, dt \geq \min \int_0^{[M;Q(z)]^2} \phi(t) \, dt \quad \text{and} \quad \int_0^{[N;P;Q(z)]^2} \phi(t) \, dt \leq \max \int_0^{[N;Q(z)]^2} \phi(t) \, dt
\]
which yields
\[
\int_0^{[M;Q(z)]^2} \phi(t) \, dt \geq \int_0^{[M;Q(z)]^2} \phi(t) \, dt \quad \text{and} \quad \int_0^{[N;Q(z)]^2} \phi(t) \, dt \leq \int_0^{[N;Q(z)]^2} \phi(t) \, dt
\]
which is a contradiction, there fore we have \( Az = z \). Similarly if we put \( u = Bz \) and \( v = z \) in given equation, we have
\[
\int_0^{[M;P;Q(z)]^2} \phi(t) \, dt \geq \min \int_0^{[M;Q(z)]^2} \phi(t) \, dt \quad \text{and} \quad \int_0^{[N;P;Q(z)]^2} \phi(t) \, dt \leq \max \int_0^{[N;Q(z)]^2} \phi(t) \, dt
\]
which gives
\[ \int_0^1 [N_{z_0}(z_0)]^2 \phi(t) dt \leq \max \left\{ \int_0^1 [N_{T_{z_0}}(z_0)]^2 \phi(t) dt, \int_0^1 [N_{A_{z_0}}(z_0)]^2 \phi(t) dt \right\} \]
and
\[ \int_0^1 [M_{z_0}(z_0)]^2 \phi(t) dt \geq \min \left\{ \int_0^1 [M_{A_{z_0}}(z_0)]^2 \phi(t) dt, \int_0^1 [M_{T_{z_0}}(z_0)]^2 \phi(t) dt \right\} \]
which is a contradiction, therefore we have \( z = \{z_0\} \). So \( A_{z_0} = T_{z_0} = z_0 \). Finally we show that \( T_{z_0} = z_0 \). By using given equation

\[ \int_0^1 [N_{z_0}(z_0)]^2 \phi(t) dt \leq \max \left\{ \int_0^1 [N_{T_{z_0}}(z_0)]^2 \phi(t) dt, \int_0^1 [N_{A_{z_0}}(z_0)]^2 \phi(t) dt \right\} \]
and
\[ \int_0^1 [M_{z_0}(z_0)]^2 \phi(t) dt \geq \min \left\{ \int_0^1 [M_{A_{z_0}}(z_0)]^2 \phi(t) dt, \int_0^1 [M_{T_{z_0}}(z_0)]^2 \phi(t) dt \right\} \]
which is a contradiction, therefore we have \( S_z = z = z_0 \). So \( S_z = T_z = z_0 \). Thus combining the results, we have \( P_z = Q_z = A_z = T_z = z_0 \). Thus \( z_0 \) is a common fixed point of \( A, B, S, T, P \) and \( Q \).
For uniqueness let \( w \neq w \) be another common fixed point of \( A, T, P \) and \( Q \), then by, we have

\[
\int_0^1 [M_z, w(x)]^2 \phi(t) dt \geq \min \int_0^1 [M_z, w(x)]^2, M_z, z(x), M_z, w(x) \phi(t) dt
\]

\[
\int_0^1 [M_z, w(x)]^2 \phi(t) dt \geq \min \int_0^1 [M_z, w(x)]^2, M_z, z(x), M_z, w(x) \phi(t) dt
\]

\[
\int_0^1 [M_z, w(x)]^2 \phi(t) dt \geq \min \int_0^1 [M_z, w(x)]^2, M_z, z(x), M_z, w(x) \phi(t) dt
\]

\[
\int_0^1 [M_z, w(x)]^2 \phi(t) dt \geq \min \int_0^1 [M_z, w(x)]^2, M_z, z(x), M_z, w(x) \phi(t) dt
\]

\[
\int_0^1 [M_z, w(x)]^2 \phi(t) dt \geq \min \int_0^1 [M_z, w(x)]^2, M_z, z(x), M_z, w(x) \phi(t) dt
\]

\[
\int_0^1 [M_z, w(x)]^2 \phi(t) dt \geq \min \int_0^1 [M_z, w(x)]^2, M_z, z(x), M_z, w(x) \phi(t) dt
\]

which is a contradiction, therefore \( z = w \). Hence \( z \) is a unique common fixed point of \( A, T, P \) and \( Q \).

If we put \( T = I \) (I is identity mapping on \( X \)) in Theorem 4.1., we obtain the following result due to Pathak et al. [17].

**Corollary 3.1** Let \( (X, F, t) \) be a complete Menger space with \( t(x, y) = \min \{x, y\} \) for all \( x, y \in [0, 1] \) and \( P, Q, A \) and \( T \) be mappings from \( X \) into itself such that

(a) \( P(X) \subset T(X) \) and \( Q(X) \subset A(X) \),

(b) the pairs \( \{P, A\} \) and \( \{Q, S\} \) are weak compatible of type (\( \alpha \))

(c) \( P \) is continuous,

(d) \[
\int_0^1 [MPu, Qv(x)]^2 \phi(t) dt \geq \min \int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt
\]

\[
\int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt \geq \min \int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt
\]

\[
\int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt \geq \min \int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt
\]

\[
\int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt \geq \min \int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt
\]

\[
\int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt \geq \min \int_0^1 [MTv, Pu(x)]^2, [MTv, Qu(x)]^2 \phi(t) dt
\]
Ch. Shashi Kumar*1, B. Ramireddy2 and Vijaya Kumar3 / Common Fixed Point Theorems Intuitionistic Fuzzy Metric Space of Integral Type With And Contractive Condition / IJMA- 5(3), March-2014.

\[
\int_0^{[NP_u Q_v (x)]} \phi(t) \, dt \leq \max \int_0^{[N_{Tu}(x)]} \int_0^{[N_{Tu}(x)]} \phi(t) \, dt \\
\int_0^{[NP_u Q_v (x)]} \int_0^{[NP_u Q_v (x)]} \phi(t) \, dt \\
\int_0^{[NP_u Q_v (x)]} \int_0^{[NP_u Q_v (x)]} \phi(t) \, dt \\
\int_0^{[NP_u Q_v (x)]} \int_0^{[NP_u Q_v (x)]} \phi(t) \, dt \\
\int_0^{[NP_u Q_v (x)]} \int_0^{[NP_u Q_v (x)]} \phi(t) \, dt
\]

for all u, v \in X and x \geq 0, where k \in (0, 1). Then P, Q, A and T have a unique common fixed point.

If we put A = B = T = I (I is identity mapping on X) in Theorem 4.1, we have the following:

**Corollary: 3.2** Let (X, F, t) be a complete Menger space with t(x, y) = \min\{x, y\} for all x, y \in [0, 1] and P and Q be mappings from X into itself such that

(a) \( P(X) \subseteq Q(X) \)

(b) P is continuous;

(c) \( \int_0^{[MP_u Q_v (x)]} \phi(t) \, dt \geq \min \int_0^{[M_u (x)]} \int_0^{[M_u (x)]} \phi(t) \, dt \\
\int_0^{[M_u (x)]} \int_0^{[M_u (x)]} \phi(t) \, dt \\
\int_0^{[M_u (x)]} \int_0^{[M_u (x)]} \phi(t) \, dt \\
\int_0^{[M_u (x)]} \int_0^{[M_u (x)]} \phi(t) \, dt \\
\int_0^{[M_u (x)]} \int_0^{[M_u (x)]} \phi(t) \, dt
\)

for all u, v \in X and x \geq 0, where k \in (0; 1). Then P and Q have a unique common fixed point.
