#### ABSTRACT

**A** graph G (V, E) with 'n' vertices and 'm' edges is said to be even harmonious graph if f is an injection from the vertices of G to the integers from 0 to 2q such that the induced mapping  $f^*$  from the edges of G to  $\{0, 2, 4, ..., 2(q-1)\}$  defined by  $f^*(uv) = [f(u) + f(v)] (mod 2q)$  is bijective.

Key words: Cyclic graphs, Wheel graphs, Fan graphs, Web graph.

#### **1. INTRODUCTION**

A graph labeling is an assignment of integers to the vertices or edges or both subject to certain conditions. Graph labeling was introduced in the late 1960's. For detailed survey on graph labeling we refer to Gallian [1]. To begin with simple graph with 'p' vertices and 'q' edges. The definitions and other information which are used for the present investigation are given.

#### 2. DEFINITIONS

**Definition 2.1: Even harmonious graph:** A function f is said to be an even harmonious graph with q edges if f is an injection from the vertices of G to the integers of 0 to 2q and the induced function  $f^*$  from the edges of G to  $\{0, 2, ...2(q-1)\}$  defined by  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  is bijective.

**Definition 2.2: Wheel graph:** The wheel graph  $W_n$  is defined to be the join of  $K_1$  and  $C_n$  ie the wheel graph consists of edges which joins a vertex of  $K_1$  to every vertex of  $C_n$ .

**Definition 2.3: Fan graph:** Fan  $f_n$  ( $n \ge 2$ ) is obtained by joining all vertices of  $P_n$  to  $K_1$  and  $K_1$  is called as the center of  $f_n$  and contains n+1 vertices and 2n-1 edges ie  $f_n = P_n + K_1$ .

#### 3. RESULTS

**Theorem 3.1:** G is a  $C_{2n+1}$  graph where  $n \ge 0$  of order n and size m. The amalgamation of G with Star graph  $S_n$  order 'n' and size (n-1) is even harmonious graph.

**Proof:**  $G_{amal} = \{V, E, f^*\}$  is a graph. Let the vertex set of  $G_{amal}(V) = \{v_1, v_2, v_3, v_4, v_5 \dots v_n\}$  and edges set of  $G_{amal}(E) = \{e_1, e_2, e_3, e_4, e_5, \dots e_n\}$  label the vertices from 0 to 2q and edge 0 to 2(q-1) such that  $G_{(amal)} = V \times V \rightarrow E$  is bijective and is defined as  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  u,  $v \in G_{amal}(V)$  and edge labels  $\{0, 2, 4, \dots, 2 (q-1)\}$  are distinct. Hence G is even harmonious graph.

**Example:** The graph in fig (1) is  $G_{(amal)}$  of  $C_n$  with  $S_2$  which is of order 5 and size 5. So  $G_{amal}$  (V)= {0, 2, 4, 6, 8, 10} then f\* (uv) =[f(u) + f(v)] (mod 2q) such that edge labels are {0, 2, 4, 6, 8} which admits even harmonious labeling similarly,  $G_{amal}$  (C<sub>3</sub>,S<sub>3</sub>) in fig (2) is also even harmonious graph. The graph on fig (3) is general case of the above graphs.

**Note:** The same is also denoted as amalgamation of  $(K_3 \bullet S_n)$  where  $n \ge 2$ 

**Theorem 3.2:** G is  $W_{2n+1}$  graph where  $n \ge 1$  of order n and size m. The amalgamation of G with star graph  $S_n$  order 'n' and size (n-1) is even harmonious graphs.

**Proof:**  $G_{amal} = \{V, E, f^*\}$  is a graph. Let the vertex set of  $G_{amal}(V) = \{v_1, v_2, v_3, v_4, v_5, ..., v_n\}$  and edges set  $G_{amal}(E) = \{e_1, e_2, e_3, e_4, e_5, ..., e_n\}$  label the vertices from 0 to 2q and edge 0 to 2(q-1), label the central vertex as 2 is fixed such that  $G_{(amal)} = V \times V \rightarrow E$  is bijective and is defined by  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  u,  $v \in G_{amal}(V)$  and edge labels  $\{0, 2, 4, ..., 2 \pmod{q-1}\}$  are distinct. Hence G is even harmonious graph.

**Example:** The graph in fig (1) is  $G_{(amal)}$  of  $W_n$  with  $S_2$  which is of order 6 and size 8. So  $G_{amal}(V) = \{0, 2, 4, 6, 8, 10, 12, 14, 16\}$  then  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  such that edge labels are  $\{0, 2, 4, 6, 8, 10, 12, 14\}$  which admits even harmonious labeling similarly,  $G_{(amal)}(W_3, S_3)$  in fig (2) is also even harmonious graph. The graph on fig (3) is general case of the above graphs.

**Note:** The same is also denoted as amalgamation of  $(K_4 \bullet S_n)$  where  $n \ge 2$ 

**Theorem 3.3:** G is a fan graph. The amalgamation of G with star graph  $S_n$  order 'n' and size (n - 1) is even harmonious graphs.

**Proof:**  $G_{amal} = \{V, E, f^*\}$  is a graph. Let the vertex set of  $G_{amal}(V) = \{v_1, v_2, v_3, v_4, v_5, ..., v_n\}$  and edges set  $G_{amal}(E) = \{e_1, e_2, e_3, e_4, e_5, ..., e_n\}$  label the vertices from 0 to 2q and edge label 0 to 2(q-1), label one duplicate vertex in star graph [5] such that  $G_{(amal)} = VxV \rightarrow E$  is bijective is defined as.  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  $u, v \in G_{amal}(V)$  and edge labels  $\{0, 2, 4, ---2 (q-1)\}$  are distinct .Hence G is even harmonious graph.

**Example:** The graph in fig (1) is  $G_{amal}$  of  $f_n$  with  $S_2$  which is of order 6 and size7. So  $G_{amal}(V) = \{0, 2, 4, 6, 8, 10, 12, 14\}$  then  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  such that edge labels are  $\{0, 2, 4, 6, 8, 10, 12, \}$  which admits even harmonious labeling similarly,  $G_{(amal)}(f_3, S_3)$  in fig (2) is also even harmonious graph. The graph on fig (3) is general case of the above graphs.

Shigehalli V.S<sup>1</sup>, Chidanand. A. Masarguppi\*<sup>2</sup> / Amalgamation Of Even Harmonious Graphs with Star Graphs/ IJMA- 6(6), June-2015.

**Theorem 3.4:** G is a  $\{(C_3 \times K_2) \bullet S_n\}$  also known as closed web graph denoted as  $(\mathcal{W}_{\mathfrak{Z}})$  where  $n \ge 2$  which is of order 6 and size 9 The amalgamation of G with Star graph  $S_n$  order n and size (n-1) is even harmonious graph.

**Proof:**  $G_{amal} = \{V, E, f^*\}$  is a graph. Let the vertex set of  $G_{amal}(V) = \{v_1, v_2, v_3, v_4, v_5, \dots, v_n\}$  and edge set  $G_{amal}(E) = \{e_1, e_2, e_3, e_4, e_5, \dots, e_n\}$  label the vertices from 0 to 2q and edge label 0 to 2(q-1), label one duplicate vertex in star graph [5] such that  $G_{(amal)} = VxV \rightarrow E$  is bijective is defined as  $f^*(uv) = [f(u) + f(v)] \pmod{2q} u$ ,  $v \in G_{amal}(V)$  and edge labels  $\{0, 2, 4, \dots, 2(q-1)\}$  are distinct. Hence G is even harmonious graph.

**Example:** The graph in fig (1) is  $G_{amal}$  of ( $C_3 \times K_2$ ) with  $S_2$  which is of order 6 and size 9.So  $G_{amal}(V) = \{0, 2, 4, 6, 8, 10, 12, 14, 16, 18\}$  then  $f^*(uv) = [f(u) + f(v)] \pmod{2q}$  such that edge labels are  $\{0, 2, 4, 6, 8, 10, 12, 14, 16\}$  which admits even harmonious labeling similarly,  $G_{amal}(\mathcal{W}_3, S_2)$  in fig (2) is also even harmonious graph. The graph on fig (3) is general case of the above graphs.

#### CONCLUSION

In this paper we have observed that Even harmonious graphs most of the graph obtained by amalgamation are even harmonious in future the same process will be analyzed for some graphs.
