ABSTRACT
The Wiener Index is a graphical invariant that has found extensive application in all branches of science. It is a distance based topological index defined as the sum of the distance between all pairs of vertices in a graph. A generating function, which we call Wiener polynomial is also defined. In this paper, Wiener index and Wiener polynomial of Wheel graph, Friendship graph and Barbell graph are obtained.

Keywords: Barbell graph, Friendship graph, Wheel graph, Wiener Index, Wiener Polynomial.

Classification Number: 05C05, 05C12, 05C15, 05C75, 05C90.

1. INTRODUCTION
All graphs considered in this paper are finite, undirected and simple graphs. We refer the reader to (Cha, Les; 1986) for terminology and notations. A graph \( G = (V,E) \) is a set of finite, non empty set of objects called vertices together with a set of unordered pair of distinct vertices of \( G \) called edges. The vertex set of \( G \) is denoted by \( V(G) \) and the edge set is denoted by \( E(G) \). If \( e = \{u,v\} \) is an edge of \( G \), then \( u \) and \( v \) are adjacent vertices, while \( u \) and \( e \) are incident, as are \( v \) and \( e \). The distance \( d_G(u,v) \), from a vertex \( u \) to a vertex \( v \) in a connected graph \( G \) is the length of the shortest \( u - v \) path in \( G \).

The Wiener Index is the first topological index to be used in Chemistry. It was introduced in 1947 by Harold Wiener. Wiener himself conceived ‘W’ for acyclic molecules and defined it in a different manner. The definition of the Wiener Index in terms of distances between vertices of a graph was first given by Hosoya. Wiener index has many applications in Chemistry and Communication Theory. Wiener showed that the Wiener Index is closely correlated with the boiling points of Alkane molecules. In his later work, he showed that it is also correlated with other quantities including the parameters of its critical point, the density, surface tension and viscosities of its liquid phase and surface area of the molecule.

Wiener Index is defined as the sum of the distances between all pairs of vertices of a graph (Wei, Li; 2014) and is denoted by \( W(G) \). That is, \( W(G) = \sum_{u,v \in V(G)} d(u,v) \).

2. WHEEL GRAPH
A Wheel graph is a graph with \( n \) vertices, formed by connecting a single vertex to all vertices of \( (n-1) \) cycle (Buc, Fre; 1988).

Corresponding Author: U. Mary*

It is denoted as \( W_n \). Wheel graphs are planar graphs and as such have a unique planar embedding. They are self-dual and the planar dual of any wheel graph is an isometric graph. Any maximal planar graph, other than \( K_4 = W_4 \), contain as a sub graph either \( W_5 \) or \( W_6 \). There is always a Hamiltonian cycle in the wheel graph and there are \( (n^2 - 3n + 3) \) cycles in \( W_n \)[5].

**Theorem 2.1:** Let \( W_p \) be the wheel graph of order \( p \) where \( p \geq 3 \) and the wiener index of the wheel graph \( W_p \) is 
\[
W(W_p) = (p-2)(p-1).
\]

**Proof:** The wiener index of \( W_p \) for \( p = 4, 5, 6 \) etc can be computed as follows.

By virtue of definition of wiener index, we get
\[
W(W_4) = 6
\]
\[
W(W_5) = 12
\]
\[
W(W_6) = 20
\]
\[
W(W_7) = 30
\]

Proceeding like this, we observe that \( W(W_p) = (p-2)(p-1) \).

**Remark 2.2:** The wiener polynomial of \( W_p \) for \( p = 4, 5, 6 \) etc is given as follows.

\[
W(W_4, x) = 6x
\]
\[
W(W_5, x) = 2x^2 + 8x
\]
\[
W(W_6, x) = 5x^2 + 10x
\]
\[
W(W_7, x) = 9x^2 + 12x
\]

**Proof:** For \( W_p, p = 4 \), there are 6 pairs of vertices contribute distance one to the graph.

Therefore, \( W(W_4, x) = 6x \)

For \( W_p, p = 5 \), there are 8 pairs of vertices contribute distance one to the graph and 2 pairs of vertices contribute distance two to the graph.

Therefore, \( W(W_5, x) = 2x^2 + 8x \).

Similarly, \( W(W_6, x) \) and \( W(W_7, x) \) are found and are tabulated below.

\[
\begin{array}{cccc}
W_4 & W_5 & W_6 & W_7 \\
W(G) & 6 & 12 & 20 & 30 \\
W(G, x) & 6x & 2x^2 + 8x & 5x^2 + 10x & 9x^2 + 12x \\
\end{array}
\]
3. FRIENDSHIP GRAPH

The friendship graph $F_n$ can be constructed by joining $n$ copies of triangle graph with a common vertex. It is denoted by $F_n$ and it is a planar, undirected graph with $(2n+1)$ vertices and $3n$ edges (Pau, Alf;1966).

In this graph every two vertices have exactly one neighbour in common. If a group of people has the property that every pair of people has exactly a friend in common, then there must be one person who is a friend to all others.[4]

Theorem 3.1: Let $F_p$ be the friendship graph of order $p$ where $p \geq 3$ and the wiener index of the friendship graph $F_p$ is $W(F_p) = 3p + 2\left(2p + 1\right)C_2 - 3p$.

Proof: We observe that the friendship graph $F_2$ has two copies of triangle graph $K_3$ with a common neighbour. The friendship graph $F_3$ has three copies of triangle graph $K_3$ with a common neighbour and so on.

To find the distance between pairs of vertices in $F_p$, we classify the graph as follows.
(i) pairs of vertices in $p$ copies of $K_3$.

The wiener index contributed by $p$ copies of $K_3$ is given by $3p$.

(ii) other pairs of vertices in the graph $F_p$.

The wiener index contributed by the remaining pairs of vertices in $F_p$ is given by $2\left(2p + 1\right)C_2 - 3p$.

Hence, the Wiener index of Friendship Graph $F_p$ is $3p + 2\left(2p + 1\right)C_2 - 3p$.

Remark 3.2: The Wiener polynomial of $F_p$ for $p = 2, 3, 4$ etc is given as follows.

$W(F_2, x) = 4x^2 + 6x$

$W(F_3, x) = 12x^2 + 9x$

$W(F_4, x) = 24x^2 + 12x$

Proof: For $F_2$, $p=2$, there are 6 pairs of vertices contributing distance one to the graph and 4 pairs of vertices contributing distance two to the graph.

Therefore, $W(F_2, x) = 4x^2 + 6x$.

For $F_3$, $p=3$, there are 9 pairs of vertices contributing distance one to the graph and 12 pairs of vertices contributing distance two to the graph.

Therefore, $W(F_3, x) = 12x^2 + 9x$.

For $F_4$, $p=4$, there are 12 pairs of vertices contributing distance one to the graph and 24 pairs of vertices contributing distance two to the graph.

Therefore, $W(F_4, x) = 24x^2 + 12x$.

The Wiener Index and Wiener Polynomial of $F_p$ for $p = 2, 3, 4$ are tabulated below.

4. BARBELL GRAPH

A n-barbell graph is the simple graph obtained by connecting two copies of a complete graph $K_n$ by a bridge and it is denoted by $B(K_p, K_p)$[6].

Theorem 4.1: Let $B(K_p, K_p)$ be the Barbell graph of order $p$ where $p \geq 3$ and the Wiener index of the barbell graph $B(K_p, K_p)$ is $W(B(K_p, K_p)) = (p^3 - p^2 + 4p - 3)$.

Proof: The Wiener index for $W_p, p = 3,4,5$ etc… can be computed as follows:

By virtue of definition of Wiener index, we get the following.

$W(B(K_3, K_3)) = 27$
$W(B(K_4, K_4)) = 52$
$W(B(K_5, K_5)) = 85$
$W(B(K_6, K_6)) = 126$

Proceeding like this, we observe that $W(B(K_p, K_p)) = (p^3 - p^2 + 4p - 3)$.

Remark 4.2: The Wiener Polynomial of $B(K_p, K_p)$ for $p = 3,4,5,6$ etc is given as follows:

$W(B(K_3, K_3), x) = 4x^3 + 4x^2 + 7x$
$W(B(K_4, K_4), x) = 9x^3 + 6x^2 + 13x$
$W(B(K_5, K_5), x) = 16x^3 + 8x^2 + 21x$
$W(B(K_6, K_6), x) = 25x^3 + 10x^2 + 31x$

Proof: For $B(K_3, K_3)$ for $p = 3$, there are 7 pairs of vertices contributing distance one to the graph, 4 pairs of vertices contributing distance two to the graph and 4 pairs of vertices contributing distance three to the graph.

Therefore, $W(B(K_3, K_3); x) = 4x^3 + 4x^2 + 7x$.

For $B(K_4, K_4)$ for $p = 4$, there are 13 pairs of vertices contributing distance one to the graph, 6 pairs of vertices contributing distance two to the graph and 9 pairs of vertices contributing distance three to the graph.

Therefore, $W(B(K_4, K_4), x) = 9x^3 + 6x^2 + 13x$.

For $B(K_5, K_5)$ for $p = 5$, there are 21 pairs of vertices contributing distance one to the graph, 8 pairs of vertices contributing distance two to the graph and 16 pairs of vertices contributing distance three to the graph.

Therefore $W(B(K_5, K_5); x) = 16x^3 + 8x^2 + 21x$.

For $B(K_6, K_6), p = 6$ there are 31 pairs of vertices contributing distance one to the graph, 10 pairs of vertices contributing distance two to the graph and 25 pairs of vertices contributing distance three to the graph.

Therefore, $W(B(K_6, K_6); x) = 25x^3 + 10x^2 + 31x$.

Similarly, a Wiener polynomial of $W_p, p > 7$ can be computed. Also it can be generalised as $W(B(K_p, K_p); x) = (p^2 - p + 1)x + (2p - 2)x^2 + p(p - 1)^2 x^3$. 
The Wiener index and Wiener Polynomial of $B(K_3, K_3), B(K_4, K_4), B(K_5, K_5)$ and $B(K_6, K_6)$ are tabulated here.

$$B(K_3, K_3) \quad B(K_4, K_4) \quad B(K_5, K_5) \quad B(K_6, K_6)$$

$$W(G) \quad 27 \quad 52 \quad 85 \quad 126$$

$$W(G, x) \quad 4x^3 + 4x^2 + 7x \quad 9x^3 + 6x^2 + 13x \quad 16x^3 + 8x^2 + 21x \quad 25x^3 + 10x^2 + 31x$$

**CONCLUSION**

In this paper, Wiener index for Wheel graph, Friendship graph and Barbell graph were investigated. Also the Wiener Polynomial for above graphs were obtained. This work would be extended to find Wiener index of Steiner distance and its respective Polynomial for the above graphs.
