#### Abstract

A one-to-one map from $V \cup E$ of a graph $G$ onto the integers $\{h, 2 h, 3 h, \ldots,(m+n) h\}$ is a E-Magic $h$-multiple labeling if there exist a constant $k$ such that $\varepsilon k(f)=\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e)$.A one-to-one map $f$ from $V \cup E$ of a graph $G$ onto the integers $\{h, 2 h, 3 h, \ldots,(m+n) h\}$ is a $V$-Magic $h$-multiple labeling if there exist a constant $k$ such that $f(u)+\sum_{v \in N(u)} f(u) v=k$ where $h$ is any positive integer. In this Paper, we obtain the E-magic strength of $h$ multiple labeling of the path $P_{n}$ on $n$-vertices, the $n$-bi star $B_{n, n}$ obtained from two disjoint copies of $K_{1, n}$ by joining the center vertices by an edge and the tree $\left\langle K_{1, n}: 2\right\rangle$ obtained from $B_{n, n}$ by subdividing the middle edge with a new vertex.Also we obtain the $V$-magic strength of $h$-multiple labeling of the path $P_{n}$ on $n$-vertices and 4-connected graph $H_{4, n}$ on $n$-vertices

Keywords: Magic labeling, E-Magic Strength, E-Magic h-multiple labelling, graph $n P_{2}$, $V$-Magic h-multiple labeling and structure of $H_{m, n}$

## 1. INTRODUCTION

A labeling of a graph $\mathrm{G}(\mathrm{V}, \mathrm{E})$ is a mapping from the set of vertices ,edges or both vertices and edges to the set of labels. Based on the domain we distinguish vertex labelings, edge labelings and total labelings. In most applications the labels are positive (or nonnegative) integers, though in general real numbers could be used. Various labelings are obtained based on the requirements put on the mapping. Magic labelings were introduced by sedlacek in 1963[6]. In general for a magic type labeling we require the sum of labels related to a vertex (a vertex magic labeling) or to an edge (an edge magic labeling) to be constant all over the graph.

Definition 1.1: For any magic labeling f of G , there is a constant k such that $f(x)+f(y)+f(x y)=k$, $x y \in E(G)$.

## 2. E-MAGIC STRENGTH OF H-MULTIPLE LABELING OF GRAPHS

Definition 2.1 [3]: The E-magic strength of $G$, $\operatorname{Em}(G)$,is defined as the minimum of all $k$ where the minimum is taken over all magic labelings f of G . That is $\operatorname{Em}(\mathrm{G})=\min \{\mathrm{k}: \mathrm{f}$ is a magic labeling of G$\}$. Let f be a magic labeling of G with the constant $k$. Then adding all constants obtained at each edge we get $\varepsilon k(f)=\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e)$

Definition 2.2: Let h be any positive integer.A one-to-one map from $V \cup E$ of a graph $G$ onto the integers $\{h, 2 h, 3 h, \ldots,(m+n) h\}$ is a E-Magic h-multiple labeling if there exist a constant k such that
$\varepsilon k(f)=\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e)$
A graph which admits E-Magic h-multiple labeling then it is called E-Magic h-multiple graph.
Theorem 2.1: $\operatorname{Em}\left(P_{2 n}\right)=h(5 n+1)$ and $\operatorname{Em}\left(P_{2 n+1}\right)=h(5 n+3)$

Proof: We prove this theorem by assigning a magic labeling to $P_{2 n}$ and $P_{2 n+1}$

Let $v_{1}, v_{2}, \ldots, v_{2 n}$ be the consecutive vertices and $e_{1}, e_{2}, \ldots, e_{2 n-1}$ be the consecutive edges of $P_{2 n}$
That is , $e_{i}=v_{i} v_{i+1}$ for $1 \leq i \leq 2 n-1$

Define $f: V \cup E \rightarrow\{h, 2 h, \ldots,(2 n-1) h\}$ by

$$
\begin{aligned}
& f\left(v_{2 i-1}\right)=i h \quad \text { for } \quad 1 \leq i \leq n \\
& f\left(v_{2 i}\right)=h(n+i) \text { for } 1 \leq i \leq n \\
& f\left(e_{i}\right)=h(4 n-i) \text { for } 1 \leq i \leq 2 n-1
\end{aligned}
$$

Thus $E m\left(P_{2 n}\right) \leq h(5 n+1)$
Since $\varepsilon\left(P_{2 n}\right)=2 n-1$, and hence $\varepsilon+v=4 n-1$

If f is a magic labeling of $P_{2 n}$ with constant $k(f)$ then $\varepsilon k(f)=\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e)$
That is, $(2 n-1) k(f)=\sum_{i=2}^{2 n-1} 2 h\left(v_{i}\right)+h\left(v_{1}\right)+h\left(v_{2 n}\right)+h \sum_{i=1}^{2 n-1} f\left(e_{i}\right)$

$$
\begin{aligned}
& =h \sum_{i=1}^{2 n} f\left(v_{i}\right)+h \sum_{i=1}^{2 n-1} f\left(e_{i}\right)+h \sum_{i=2}^{2 n-1} f\left(v_{i}\right) \\
& =(h+2 h+\ldots+(4 n-1) h)+h \sum_{i=2}^{2 n-1} f\left(v_{i}\right) \\
& =h(4 n-1)(2 n)+h \sum_{i=2}^{2 n-1} f\left(v_{i}\right)
\end{aligned}
$$

$\therefore k(f)=\frac{h 2 n(4 n-1)}{2 n-1}+h \sum_{i=2}^{2 n-1} \frac{f\left(v_{i}\right)}{2 n-1}$

$$
>(4 n-1) h+2 h+(n-1) h=5 n
$$

Hence $k(f) \geq(5 n+1) h$ which implies that $E m\left(P_{2 n}\right) \geq h(5 n+1)$
$\therefore E m\left(P_{2 n}\right)=h(5 n+1)$
Similarly, we can prove that $E m\left(P_{2 n+1}\right)=h(5 n+3)$
Example 2.1: Fig. 2.1 Shows that $\operatorname{Em}\left(P_{9}\right)=46$

Fig. 2.1
Theorem 2.2: $\operatorname{Em}\left(B_{n, n}\right)=h(5 n+6)$
Proof: Let $V\left(B_{n, n}\right)=\left\{u, v ; u_{1}, u_{2}, \ldots, u_{n} ; v_{1}, v_{2}, \ldots, v_{n}\right\}$ and $E\left(B_{n, n}\right)=\left\{u u_{i}, v v_{i}, u v: 1 \leq i \leq n\right\}$
Define a function $f: V \cup E \rightarrow\{h, 2 h, \ldots,(2 n+1) h\}$ by
$f\left(u_{i}\right)=i h$ for $1 \leq i \leq n, f(u)=h(n+2), f(v)=h(n+1), f(u) v=h(3 n+3), f\left(u_{i}\right) u=h(4 n+4-i)$ for $1 \leq i \leq n$ and $f\left(v v_{i}\right)=h(2 n+3-i)$ for $1 \leq i \leq n$

Clearly $f$ is a E-magic h-multiple labeling of $B_{n, n}$ with $k(f)=h(5 n+6)$ and hence $\operatorname{Em}\left(B_{n, n}\right) \leq h(5 n+6)$

Let f be a E-magic h-multiple labeling of $B_{n, n}$ with $k(f)$

$$
\begin{aligned}
\text { Then } \varepsilon k(f) & =\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e) \\
& =h \sum_{i=1}^{n} f\left(v_{i}\right)+h \sum_{i=1}^{n} f\left(u_{i}\right)+h(n+1) f(u)+h(n+1) f(v)+h \sum_{e \in E} f(e) \\
(2 n+1) k(f) & =h \sum_{v \in V} f(v)+h \sum_{e \in E} f(e)+n h f(u)+n h f(v) \\
& =h+2 h+\ldots+(4 n+3) h+n h f(u)+n h f(v) \\
& =\frac{h(4 n+3)(4 n+4)}{2}+n h(f(u)+f(v))
\end{aligned}
$$

$\therefore k(f)=h(4 n+5)+\frac{h}{2 n+1}(n(f(u)+f(v))+1)$
Since $k(f)$ is an integer, $h\left(\frac{n(f(u)+f(v))+1}{2 n+1}\right)$ is also an integer.
That is $n(f(u)+f(v))+1 \equiv 0 \bmod (2 n+1)$
And hence $n(f(u)+f(v)) \equiv 2 n \bmod (2 n+1)$ which implies that $f(u)+f(v) \equiv 2 \bmod (2 n+1)$
But $f(u)+f(v) \geq 3$ and thus $f(u)+f(v) \geq 2 n+3$
$\therefore k(f) \geq h(4 n+5)+[n(2 n+3)+1] h / 2 n+1$ $=h(5 n+6)$
This shows that $E m\left(B_{n, n}\right) \geq h(5 n+6)$

Hence $\operatorname{Em}\left(B_{n, n}\right)=h(5 n+6)$
Example 2.2: Fig. 2.2 Shows that $\operatorname{Em}\left(B_{5,5}\right)=155$

Fig. 2.2
Theorem 2.3: $E m\left(<K_{1, n}: 2>\right)=h(4 n+9)$
Proof: Define the labeling f on $\left\langle K_{1, n}: 2>\right.$ as follows
$f(u)=h, f(v)=2 h, f(w)=h(n+3)$
$f\left(u_{i}\right)=h(i+2)$ for $1 \leq i \leq n$,
$f\left(v_{i}\right)=h(n+3+i)$ for $1 \leq i \leq n$,
$f(u w)=h(3 n+5), f(v w)=h(3 n+4), f\left(u u_{i}\right)=h(4 n+6-i)$ for $1 \leq i \leq n$
$f\left(v v_{i}\right)=h(3 n+4-i)$ for $1 \leq i \leq n$

One can check that the above labeling f is a E-magic h-multiple labeling of $<K_{1, n}: 2>$ with $k(f)=h(4 n+9)$
Thus $\left.E m\left(<K_{1, n}: 2\right\rangle\right) \leq h(4 n+9)$
Now we show that $E m\left(\left\langle K_{1, n}: 2\right\rangle\right) \geq h(4 n+9)$

Let f be a magic labeling of $\left\langle K_{1, n}: 2>\right.$ with constant $k(f)$
Then $\varepsilon k(f)=\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e)$
That is, $(2 n+2) k(f)=\sum_{i=1}^{n} h\left(u_{i}\right)+h \sum_{i=1}^{n} f\left(v_{i}\right)+h(n+1) f(u)+h(n+1) f(v)+2 h(w)+h \sum_{e \in E} f(e)$

$$
\begin{aligned}
(2 n+2 \emptyset f) & =h \sum_{v \in V} f(v)+h \sum_{e \in E} f(e)+n h f(u)+n h f(v)+h f(w) \\
& =h+2 h+\ldots+(4 n+5) h+n h f(u)+n h f(v)+h f(w) \\
& =\frac{h(4 n+5)(4 n+6)}{2}+n h(f(u)+f(v))+h f(w) \\
& =\frac{h(4 n+5)(4 n+6)}{2(2 n+2)}+h(n(f(u)+f(v))+f(w)) /(2 n+2)
\end{aligned}
$$

$\therefore k(f)=h(4 n+7)+\frac{h}{2 n+2}(n(f(u)+f(v))+f(w)+1)$

Since $k(f)$ is an integer and $f(u)+f(v) \geq 3, E m\left(<K_{1, n}: 2>\right) \geq h(4 n+9)$
Hence $\left.E m\left(<K_{1, n}: 2\right\rangle\right)=h(4 n+9)$
Example 2.3: Fig. 2.3 Shows that $E m\left(\left\langle K_{1,4}: 2\right\rangle\right)=50$

Fig. 2.3
Definition 2.2: The graph $n P_{2}$ is defined as the disjoint union of $n$ copies of $P_{2}$.

Theorem 2.4: $\operatorname{Em}\left((2 n+1) P_{2}\right)=h(9 n+6)$ for any $n \geq 0, n$ is odd

Proof: Let the vertices of $(2 n+1) P_{2}$ be $u_{1}, u_{2}, \ldots, u_{2 n+1} ; v_{1}, v_{2}, \ldots, v_{2 n+1}$ and let the edge set be $\left\{u_{i} v_{i}: 1 \leq i \leq 2 n+1\right\}$
Define $f: V \cup E \rightarrow\{h, 2 h, 3 h, \ldots, h(6 n+3)\}$ in such a way that $f\left(u_{i}\right)=i h$ for $1 \leq i \leq 2 n+1$
$f\left(v_{i}\right)=h(6 n+4-2 i)$ for $1 \leq i \leq n$,
$f\left(v_{n+i}\right)=h(6 n+5-2 i)$ for $1 \leq i \leq n+1$,
$f\left(u_{i} v_{i}\right)=h(3 n+2+i)$ for $1 \leq i \leq n$,
$f\left(u_{n+i} v_{n+i}\right)=h(2 n+1+i)$ for $1 \leq i \leq n+1$
It is easy to check that f is a E- magic h-multible labeling of $(2 n+1) P_{2}$ with $k(f)=h(9 n+6)$

Let f be a E-magic h-multiple labeling of $(2 n+1) P_{2}$ with constant $k(f)$
Then $\varepsilon k(f)=\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e)$

$$
\begin{aligned}
(2 n+1) k(f) & =h \sum_{v \in V} f(v)+h \sum_{e \in E} f(e) \\
& =h+2 h+\ldots+(6 n+3) h \\
& =\frac{h(6 n+3)(6 n+4)}{2}
\end{aligned}
$$

$$
\therefore k(f)=\frac{h(6 n+3)(6 n+4)}{(2 n+1) 2}
$$

$$
=h(9 n+6)
$$

This is true for any magic labeling f of $(2 n+1) P_{2}$
Therefore, $E m\left((2 n+1) P_{2}\right)=h(9 n+6)$

Example 2.4: Fig. 2.4 Shows that $\operatorname{Em}\left(11 P_{2}\right)=255$

Fig. 2.4
Theorem 2.5: $\operatorname{Em}\left(C_{2 n+1}\right)=h(5 n+4)$

Proof: Let the vertices of $C_{2 n+1}$ be $v_{1} v_{2} \ldots v_{2 n+1} v_{1}$
Define $f: V \cup E \rightarrow\{h, 2 h, 3 h, \ldots, h(5 n+4)\}$ in such a way that $f\left(v_{2 i+1}\right)=h(i+1)$ for $0 \leq i \leq n$ $f\left(v_{2 i}\right)=h(n+1+i)$ for $1 \leq i \leq n$,
$f\left(v_{i} v_{i+1}\right)=h(4 n+2-i)$ for $1 \leq i \leq 2 n$,
$f\left(v_{2 n+1} v_{1}\right)=h(4 n+2)$

It is easy to check that f is a E - magic h-multiple labeling of $C_{2 n+1}$ with $k(f)=h(5 n+4)$

Thus, $\operatorname{Em}\left(C_{2 n+1}\right) \leq h(5 n+4)$
Let f be a E-magic h-multiple labeling of $C_{2 n+1}$ with constant $k(f)$

$$
\begin{aligned}
& \text { Then } \begin{aligned}
\varepsilon k(f) & =\sum_{v \in V} d(v) f(v)+\sum_{e \in E} f(e) \\
(2 n+1) k(f) & =h \sum_{v \in V} 2 f(v)+h \sum_{e \in E} f(e) \\
& =h \sum_{v \in V} f(v)+h \sum_{e \in E} f(e)+h \sum_{v \in V} f(v) \\
& =h+2 h+\ldots+(4 n+2) h+h \sum_{v \in V} f(v) \\
& \geq \frac{h(4 n+2)(4 n+3)}{2}+h+2 h+\ldots+(2 n+1) h
\end{aligned}
\end{aligned}
$$

$\therefore k(f) \geq h(5 n+4)$

$$
E m\left(C_{2 n+1}\right) \geq h(5 n+4)
$$

Hence $\operatorname{Em}\left(C_{2 n+1}\right)=h(5 n+4)$

Example 2.5: Fig. 2.5 Shows that $\operatorname{Em}\left(C_{9}\right)=48$

Fig 2.5
Theorem 2.6: $\operatorname{Em}\left(P_{n}^{2}\right)=3 n h$

Proof: Let the vertices of $P_{n}^{2}$ be $v_{1}, v_{2}, \ldots, v_{n}$
Define $f: V \cup E \rightarrow\{h, 2 h, 3 h, \ldots, 3 n h\}$ in such a way that
$f\left(v_{i}\right)=i h$ for $1 \leq i \leq n$,
$f\left(v_{i} v_{i+1}\right)=h(3 n-(2 i+1))$ for $1 \leq i \leq n-1$,
$f\left(v_{i} v_{i+2}\right)=h(3 n-(2 i+2)) 1 \leq i \leq n-2$
Thus, $\operatorname{Em}\left(P_{n}^{2}\right) \leq 3 n h$
But since $\varepsilon\left(P_{n}^{2}\right)=(3 n-3) h$, we have $E m\left(P_{n}{ }^{2}\right) \geq 3 n h$
Hence $\operatorname{Em}\left(P_{n}^{2}\right)=3 n h$
Example 2.6: Fig. 2.6 Shows that $\operatorname{Em}\left(P_{6}{ }^{2}\right)=90$

Fig. 2.6

## 3. V- MAGIC STRENGTH OF H-MULTIPLE LABELING OF GRAPHS

Definition 3.1 [4]: A one-to-one map $f: V \cup E \rightarrow\{1,2,3, \ldots, m+n\}$ is a vertex-magic total labeling of $G$ if there is a constant k so that for every vertex $\mathrm{u}, w_{k}(u)=f(u)+\sum_{v \in N(u)} f(u) v=k$. So the magic requirement is the associated weight $w_{k}(u)=k$ for all $u$. The fixed integer k is called the magic constant of $f$.

Definition 3.2 [4]: Let $h$ be any positive integer. A one-to-one map $f$ from $V \cup E$ of a graph $G$ onto the integers $\{h, 2 h, 3 h, \ldots,(m+n) h\}$ is a V-Magic h-multiple labeling if there exist a constant k such that $f(u)+\sum_{v \in N(u)} f(u) v=k$. A graph which admits V-Magic h-multiple labeling then it is called V-Magic h-multiple graph.

Lemma 3.1: [1] If a non-trivial graph $G$ is vertex magic, then the magic constant $k$ is given by $k=q+\frac{p+1}{2}+\frac{q(q+1)}{p}$

Theorem 3.1: $k\left(P_{n}\right)=\frac{h(5 n-3)}{2}$ if $n$ is odd and $n \geq 3$
Proof: Let $\left\{v_{1}, v_{2}, \ldots, v_{n}\right\}$ be the consecutive vertices and $\left\{e_{1}, e_{2}, \ldots, e_{n-1}\right\}$ be the consecutive edges of $P_{n}$.
That is $E\left(P_{n}\right)=\left\{e_{i}=v_{i} v_{i+1} / 1 \leq i \leq n-1\right\}$
Define $f: V \cup E \rightarrow\{h, 2 h, 3 h, \ldots, h(2 n-1)\} \quad$ as follows
$f\left(v_{1}\right)=h(2 n-1)$
$f\left(v_{i}\right)=h(n-2+i)$ for $2 \leq i \leq n$
and $f\left(e_{i}\right)=\left\{\begin{array}{lll}\frac{h(n-i)}{2} & \text { if } i \text { is odd } \\ h\left(n-\frac{i}{2}\right) & \text { if } i \text { is even }\end{array}\right.$
Let f be an V -Magic h-multiple labeling of a graph G with the magic number k .
Then $f(E)=\{h, 2 h, 3 h, \ldots, h m\}$ and $f(u)+\sum_{v \in N(u)} f(u v)=k$ for all $u \in V$
That is $n k\left(P_{n}\right)=\sum_{u \in V} f(u)+\sum_{u \in V} \sum_{v \in N(u)} f(u v)$ for all $\quad u \in V$

$$
\begin{aligned}
& =\sum_{u \in V} f(u)+2 \sum_{e \in E} f(e) \\
& =h n(n-1)+\frac{h n(n+1)}{2}+h n(n-1)
\end{aligned}
$$

$\therefore k\left(P_{n}\right)=h(n-1)+\frac{h(n+1)}{2}+h(n-1)$
$=2 h(n-1)+\frac{h(n+1)}{2}$
$=\frac{h(5 n-3)}{2}$ if $n$ is odd and $n \geq 3$
Example 3.1: Fig. 3.1 Shows that $k\left(P_{5}\right)=55$

Fig 3.1
Remark 3.1: In [5], Bondy and Murty constructed an m-connected graph $H_{m, n}$ on n-vertices that has exactly \{mn/2\} edges. The structure of $H_{m, n}$ depends on the parities of $m$ and $n$; there are three cases.

Case-1: m even. Let $\mathrm{m}=2 \mathrm{r}$.Then $H_{2 r, n}$ is constructed as follows. It has vertices $0,1, \ldots, \mathrm{n}-1$ and two vertices i and j are joined if $i-r \leq j \leq i+r$ (where addition is taken modulo $n$ )

Case-2: m odd, n even. Let $\mathrm{m}=2 \mathrm{r}+1$.Then $H_{2 r+1, n}$ is constructed by first drawing $H_{2 r, n}$ and then adding edges joining vertex ito vertex $\mathrm{i}+(\mathrm{n} / 2)$ for $1 \leq i \leq n / 2$

Case-3: m odd, n odd. Let $\mathrm{m}=2 \mathrm{r}+1$. Then $H_{2 r+1, n}$ is constructed by first drawing $H_{2 r, n}$ and then adding edges joining vertex 0 to vertices( $\mathrm{n}-1) / 2$ and $(\mathrm{n}+1) / 2$ and vertex $i$ to vertex $\mathrm{i}+(\mathrm{n}+1) / 2$ for $1 \leq i \leq(n-1) / 2$

Theorem 3.2: $k\left(H_{4, n}\right)=\frac{h(13 n+5)}{2}$ if $n$ is odd
Proof: Let the vertex set of $H_{4, n}$ be $V=\left\{v_{1}, v_{2}, \ldots, v_{n}\right\}$ and the edge set of $H_{4, n}$ be

$$
E=\left\{v_{i} v_{i+1} / 1 \leq i \leq n-1\right\} \cup\left\{v_{n} v_{1}\right\} \cup\left\{v_{i} v_{i+2} / 1 \leq i \leq n-2\right\} \cup\left\{v_{n-1} v_{1}\right\} \cup\left\{v_{n} v_{2}\right\}
$$

Define $f: V \cup E \rightarrow\{h, 2 h, 3 h, \ldots, 3 n h\} \quad$ as follows

$$
\begin{aligned}
& f\left(v_{i}\right)= \begin{cases}\frac{h}{2}(6 n+1-i) & \text { for } \quad i \equiv 1(\bmod 2) \\
\frac{h}{2}(5 n+1-i) & \text { for } \quad i \equiv 0(\bmod 2)\end{cases} \\
& f\left(v_{i} v_{i+1}\right)= \begin{cases}\frac{h}{2}(n+2+i) & \text { for } \quad i \equiv 1(\bmod 2), \quad i \neq n \\
\frac{h}{2}(i+2) & \text { for } \quad i \equiv 0(\bmod 2)\end{cases} \\
& f\left(v_{n} v_{1}\right)=h
\end{aligned}
$$

$$
f\left(v_{i} v_{i+2}\right)= \begin{cases}2 h(n-i) & \text { for } \quad i=1,2, \ldots, \frac{n-1}{2} \\ h(3 n-2 i) & \text { for } \quad i=\frac{n+1}{2}, \frac{n+3}{2}, \ldots, n-2\end{cases}
$$

$$
f\left(v_{n-1} v_{1}\right)=h(n+2)
$$

$$
f\left(v_{n} v_{2}\right)=2 h n
$$

Suppose there exists an vertex -magic h-multiple total labeling f of a graph G with the magic number k .
Then by lemma [3.1],

$$
\begin{aligned}
k & =h(2 n)+\frac{h(n+1)}{2}+\frac{h(2 n)(2 n+1)}{n} \\
& =h\left[2 n+\frac{n+1}{2}+4 n+2\right] \\
& =\frac{h}{2}(13 n+5)
\end{aligned}
$$

Example 3.2: Fig. 3.2 Shows that $k\left(H_{4,7}\right)=96$

Fig. 3.2
