ABSTRACT

In this paper, maximal weakly open sets are introduced and characterized in fuzzy topological spaces. A non-empty fuzzy open set $A$ of a fuzzy topological space $(X, \tau)$ is said to be a fuzzy maximal weakly open set if any fuzzy open set which is contained in $A$ is either 1 or $A$.

Keywords: Fuzzy set, Fuzzy open set, Fuzzy closed set, Fuzzy minimal weakly open set.

1. INTRODUCTION

In the year 2001 and 2003, F.Nakaoka and N.oda [1] [2] [3]introduced and studied minimal open (resp.minimal closed) sets which are sub classes of open (resp.closed) sets. The complement of minimal open sets and maximal open sets are called maximal closed sets and minimal closed sets respectively. In the year 2000 M. Sheik john [4] introduced and studied weakly closed sets and weakly open sets in topological spaces. In the year 2014 R.S.Wali and Vivekananda Dembre [5] [6] introduced and studied minimal weakly open sets and maximal weakly closed sets and maximal weakly open sets and minimal weakly closed sets in topological spaces. In the year 1965, L.A.Zadeh [7] introduced the concept of fuzzy subset as a generalization of that of an ordinary subset. The introduction of fuzzy subsets paved the way for rapid research work in many areas of mathematical science. In the year 1968, C.L.Chang [8] introduced the concept of fuzzy topological spaces as an application of fuzzy sets to topological spaces. Subsequently several researchers contributed to the development of the theory and applications of fuzzy topology. The theory of fuzzy topological spaces can be regarded as a generalization theory of topological spaces. An ordinary subset $A$ or a set $X$ can be characterized by a function called characteristic function $\mu_A : X \rightarrow [0,1]$ of $A$, defined by

$$
\mu_A(x) = \begin{cases} 
1, & \text{if } x \in A, \\
0, & \text{if } x \notin A.
\end{cases}
$$

Thus an element $x \in X$ is in $A$ if $\mu_A(x) = 1$ and is not in $A$ if $\mu_A(x) = 0$. In general if $X$ is a set and $A$ is a subset of $X$ then $A$ has the following representation. $A = \{(x, \mu_A(x)): x \in X\}$, here $\mu_A(x)$ may be regarded as the degree of belongingness of $x$ to $A$, which is either 0 or 1. Hence $A$ is the class of objects with degree of belongingness either 0 or 1 only. Prof. L.A.Zadeh [6] introduced a class of objects with continuous grades of belongingness ranging between 0 and 1; he called such a class as fuzzy subset. A fuzzy subset $A$ in $X$ is characterized as a membership function $\mu_A : X \rightarrow [0,1]$, which associates with each point in $x$ a real number $\mu_A(x)$ between 0 and 1 which represents the degree or grade membership of $x$ to $A$.

1.1. Definition[1]: A proper non-empty open subset $U$ of a topological space $X$ is said to be minimal open set if any open set which is contained in $U$ is $\varnothing$ or $U$.

1.2. Definition[2]: A proper non-empty open subset $U$ of a topological space $X$ is said to be maximal open set if any open set which is contained in $U$ is $X$ or $U$.

1.3. Definition[3]: A proper non-empty closed subset $F$ of a topological space $X$ is said to be minimal closed set if any closed set which is contained in $F$ is $\varnothing$ or $F$.

1.4 Definition[3]: A proper non-empty closed subset F of a topological space X is said to be maximal closed set if any closed set which is contained in F is X or F.

1.5 Definition[4]: A subset A of (X,τ) is called weakly closed set if Cl(A) ⊆ U whenever A ⊆ U and U is semi-open in X.

1.6 Definition[4]: A subset A in (X,τ) is called weakly open set in X if A^C is weakly closed set in X.

1.7 Definition[5]: A proper non-empty weakly open subset U of X is said to be minimal weakly open set if any weakly open set which is contained in U is X or U.

1.8 Definition[6]: A proper non-empty weakly closed subset U of X is said to be maximal weakly open set if any weakly open set which is contained in U is X or U.

1.9 Definition[7]: A fuzzy subset A in a set X is a function A : X → [0, 1]. A fuzzy subset in X is empty iff its membership function is identically 0 on X and denoted by 0 or μϕ. In fact every subset of X is a fuzzy subset of X but not conversely. Hence the concept of a fuzzysubset is a generalization of the concept of a subset.

1.10 Definition[7]: If A and B are any two fuzzy subsets of a set X, then A is said to be included in B or A is contained in B iff A(x) ≤ B(x) for all x in X. Equivalently, A ≤ B iff A(x) ≤ B(x) for all x in X.

1.11 Definition[7]: Two fuzzy subsets A and B are said to be equal if A(x) = B(x) for every x in X. Equivalently A = B if A(x) = B(x) for every x in X.

1.12 Definition[7]: The complement of a fuzzy subset A in a set X, denoted by A' or 1 - A, is the fuzzy subset of X defined by A'(x) = 1 - A(x) for all x in X. Note that (A')' = A.

1.13 Definition[7]: The union of two fuzzy subsets A and B in X, denoted by A ∨ B, is a fuzzy subset in X defined by (A ∨ B)(x) = Max{μA(x), μB(x)} for all x in X.

1.14 Definition[7]: The intersection of two fuzzy subsets A and B in X, denoted by A ∧ B, is a fuzzy subset in X defined by (A ∧ B)(x) = Min{A(x), B(x)} for all x in X.

1.15 Definition[7]: A fuzzy set on X is ‘Crisp’ if it takes only the values 0 and 1 on X.

1.16 Definition[7]: Let X be a set and be a family of fuzzy subsets of X. τ is called a fuzzy topology on X iff τ satisfies the following conditions.

(i) μτ; μτ X ∈ τ: That is 0 and 1 ∈ τ
(ii) If Gi ∈ τ for i ∈ I then ∨Gi ∈ τ i ∈ I
(iii) If G, H ∈ τ then G ∧ H ∈ τ

The pair (X, τ) is called a fuzzy topological space (abbreviated as fts). The members of τ are called fuzzy open sets and a fuzzy set A in X is said to be closed if 1 - A is an fuzzy open set in X.

1.17 Remark[7]: Every topological space is a fuzzy topological space but not conversely.

1.18 Definition[7]: Let X be a fts and A be a fuzzy subset in X. Then A ∧ {B: B is a closed fuzzy set in X and B ≥ A} is called the closure of A and is denoted by A or cl(A).

1.19 Definition[7]: Let A and B be two fuzzy sets in a fuzzy topological space (X, τ) and let A ≥ B. Then B is called an interior fuzzy set of A if there exists G ∈ τ such that A ≥ G ≥ B, the least upper bound of all interior fuzzy sets of A is called the interior of A and is denoted by A^0.

2.0 FUZZY MAXIMAL WEAKLY OPEN SETS IN FUZZY TOPOLOGICAL SPACES

2.1 Definition: A non-empty fuzzy open set A of a fuzzy topological space (X, τ) is said to be a fuzzy maximal weakly open set if any fuzzy open set which is contained in A is either 1 or A.

2.2 Lemma:

(i) If A is any fuzzy maximal weakly open set and a is a fuzzy open set, then A ∨ a = 1 or a ≤ A
(ii) If A and B are fuzzy minimal weakly open sets then A ∨ B = 1 or A = B.
2.3 Theorem: If $A$, $B$ and $C$ are fuzzy maximal weakly open sets such that $A \neq B$ and if $A \land B < C$, then $A = C$ or $B = C$.

Proof: Let $A$, $B$ and $C$ be fuzzy maximal weakly open sets such that $A \neq B$ and $A \land B < C$. If $A = C$ then there is nothing to prove. But if $A \neq C$, then we have to prove that $B = C$.

Now, $B \land C = B \land (C \land 1) = B \land (C \land (A \lor B))$ by the Lemma 2.2 $A \land B = 1$.

$= B \land (C \land (A \land B))$ by hypothesis.

$= B \land (A \lor C) = B \land 1 = B \Rightarrow B \land C = B \Rightarrow B \leq C$.

From the definition of fuzzy maximal weakly open sets, it follows that $B = C$.

2.4 Theorem: If $A$, $B$, $C$ are fuzzy maximal weakly open sets which are different from each other, then $A \land B \not\leq A \land C$.

Proof: Let $A$, $B$ and $C$ be fuzzy maximal weakly open sets which are different from each other such that $A \land B < A \land C$ then we see that $A \land B < A \land C$.

(2.5) Theorem: Assume that $|\land| \geq 2$. If $A_i$ is a fuzzy maximal weakly open set for any element $i$ of $\land$ and $A_i \neq A_j$ for any elements $i$ and $j$ of $\land$ with $i \neq j$, then

(i) $1 - \forall A_i < A_j$ for some element $j$ of $\land$.

(ii) $\forall A_i \neq 0$.

2.6 Remark: If $A_i$ is a fuzzy maximal weakly open set for any element $i$ of $\land$ and $A_i \neq A_j$ for any elements $i$ and $j$ of $\land$ with $i \neq j$, and if $\Gamma$ is a proper non-empty subset of $\land$ then $\land A_i < \land A_k < \land A_i$.

Proof: Let $j$ be any element of $\land$ such that $\land A_i A_j$. Then $1 = 1 - \left( \land \land A_i \land A_j \right)$ which implies that $A_j$, which is contradiction to our assumption. Therefore $\land A_i < \land A_j$.

Again let $A_j (\land A_i)$, then $A_j A_i$, for some element $i$ of $\land$, which implies that $A_j < A_i$ by definition.

From (i) and (ii) $\land A_i \not\leq A_j \land A_i$,

(ii) $A_j \not\leq A_i$.

2.8 Remark: If $A_i$ is a fuzzy maximal weakly open set for any element $i$ of $\land$ and $A_i \neq A_j$ for any elements $i$ and $j$ of $\land$ with $i \neq j$ and if $\Gamma$ is a proper non-empty subset of $\land$ then $\land \land \land A_i \land A_i$.
2.9 Theorem: (Decomposition Theorem) Assume that $|\Lambda| \geq 2$. If $A_i$ is a fuzzy maximal weakly open set for any element $i$ of $\Lambda$ and $A_i \neq A_j$ for any elements $i$ and $j$ of $\Lambda$ with $i \neq j$, then for any element $j$ of $\Lambda$.

$$A_i = (\Lambda A_i) \lor (1 - (\Lambda A_i))$$

Proof: Let $j$ be any element of $\Lambda$ then

$$(\Lambda A_i) \lor (1 - (\Lambda A_i)) = ([\Lambda A_i] \lor [1 - (\Lambda A_i)])$$

$$i \in \Lambda \quad i \in \Lambda \setminus \{j\} i \in \Lambda \setminus \{j\}$$

$$= 1 \land A_j$$

this implies $A_i$ for any element of $\Lambda$.

2.10 Remark: If $A$ is a fuzzy maximal weakly open set for any element $i$ of $\Lambda$ and $A_i \neq A_j$ for any elements $i$ and $j$ of $\Lambda$ with $i \neq j$ and if $\Gamma$ is a proper non-empty subset of $\Lambda$, then $\Lambda A_i < \Lambda A_k$ $i \in \Lambda \neq k \in \Gamma$.

2.11 Remark: Let $A$ and $B$ be any fuzzy subsets of $X$. If $A \lor B = 1$; $A \land B$ is a fuzzy closed set and $A$ is fuzzy open set then $B$ is fuzzy closed set.

2.12 Remark: Assume that $|\Lambda| \geq 2$. If $A_i$ is a fuzzy maximal weakly open set for any element $i$ of $\Lambda$ and $A_i \neq A_j$ for any elements $i$ and $j$ of $\Lambda$ with $i \neq j$ and if $\Lambda A_i = 1$ then $\{A_i \setminus i \in \Lambda\}$ is the set of all fuzzy maximal weakly open sets of a fuzzy topology $(X, \tau)$.

2.13 Remark: If $A_i$ is a fuzzy open set for any element $i$ of $\Lambda$ and $A_i \lor A_j = 1$ for any elements $i$ and $j$ of $\Lambda$ with $i \neq j$ and if $\Lambda A_i$ is a fuzzy closed set, then $\Lambda A_i$ is a fuzzy closed set for any element $i$ of $\Lambda$.

2.14 Remark: If $A_i$ is a fuzzy maximal weakly open set for any element $i$ of $\Lambda$ and $A_i \neq A_j$, for any elements $i$ and $j$ of $\Lambda$ with $i \neq j$ and if $\Lambda A_i$ is a fuzzy closed set, then $A_i$ is a fuzzy closed set for any element $i$ of $\Lambda$.
