#### Abstract

A.Pushpalatha and K.Anitha introduced properties of $g^{*} s$-closed sets in topological space. In this paper, we introduced $g^{*} s$-irresolute maps, $g * s$-hausdorff spaces, $g^{*} s$-homeomorphism and study their basic properties in topological spaces.

Keywords: $g^{*}$ s-closed sets, $g^{*}$ s-open sets, $g^{*} s$-continuous map, $g^{*}$ s-irresolute map, $g^{*} s$-hausdorff and $g^{*} s$ homeomorphism.

2000 Mathematics subject classification: 54A05, 54C08, 54C05.

## 1. INTRODUCTION

In 1970, Levine [8] first considered the concept of generalized closed (briefly g-closed) sets were defined and investigated. Arya and Nour [1] defined generalized semi open sets (briefly gs-open) using semi open sets. In 1987, Bhattacharyya and Lehiri [2] introduced the class of semi-generalized closed sets (briefly sg-closed). A.Pushpalatha and K.Anitha $[10,11]$ introduces properties of $g * s$-closed sets in topological space.

The notion homeomorphism plays a very important role in topology. In this paper, we introduce a new class of irresolute map called $\mathrm{g}^{*}$ s-irresolute map and then we study $\mathrm{g}^{*} \mathrm{~s}$-hausdorff, $\mathrm{g}^{*}$ s-homeomorphism and $\mathrm{g}^{*}$ schomeomorphism.

## 2. PRELIMINARIES

Throughout this paper we shall denote by $(X, \tau)$ a topological space. For any subset $A \subseteq X, \operatorname{int}(A)$ and $c l(A)$ denote the interior of A and the closure of A with respect to $\tau$.

We shall require the following known definitions.
Definition: 2.1[9] Let( $\mathrm{X}, \tau$ ) be a topological spaces. A subset A of X is called semi-open if $\mathrm{A} \subseteq \mathrm{cl}$ (int (A)) and semiclosed if int $(\mathrm{cl}(\mathrm{A})) \subseteq \mathrm{A}$. The intersection of all semi closed sets containing A is called the semi closure of A, denoted by scl (A). The union of all semi open sets contained in A is called the semi interior of A, denoted by sint (A).

Definition: 2.2[10] Let $(X, \tau)$ be a topological space. A subset A of $X$ is called gs- closed if scl $(A) \subseteq U$ whenever $A \subseteq U$ and $U$ is open in (X, $\tau)$.

Result: 2.3[9] The complement of gs-closed set is gs-open.
Definition: 2.4[10] Let ( $\mathrm{X}, \tau$ ) be a topological space. A subset A of X is called $\mathrm{g}^{*}$ s-closed if scl (A) $\subseteq U$ whenever $A \subseteq U$ and $U$ is gs-open in $(X, \tau)$. The complement of $g^{*} s$-closed set is $g^{*} s$-open.

Result: 2.5[10] Every closed set is $\mathrm{g}^{*} \mathrm{~s}$-closed.
Definition: 2.6 [10] A map $f: X \rightarrow Y$ is called $g * s$-open map if $f(U)$ is $g * s$-open in y for every open set $U$ in $X$. Every open map is $g^{*} s$-open map. A map $f: X \rightarrow Y$ is called $g^{*} s$-closed map if for each closed set $F$ in $X, f(F)$ is a $g^{*} s$ - closed set in Y.

Theorem: 2.7 [13] For any bijection $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ the following are equivalent.
(i) $\mathrm{f}^{-1}:(\mathrm{Y}, \sigma) \rightarrow(\mathrm{X}, \tau)$ is $\mathrm{g}^{*} \mathrm{~s}$-continuous.
(ii) $f$ is a $\mathrm{g}^{*} \mathrm{~s}$-open map
(iii) f is a $\mathrm{g}^{*} \mathrm{~s}$-closed map.

Definition: 2.8 [11] A map $f: X \rightarrow Y$ from a topological space $X$ into a topological space $Y$ is called $g^{*} s$-continuous if the inverse image of every closed set in Y is $\mathrm{g}^{*} \mathrm{~s}$-closed in X .

Result: 2.9[11] Every continuous map is $\mathrm{g}^{*} \mathrm{~s}$-continuous and g*s- continuous map is gs-continuous.
Definition: 2.10 [11] A map $f: X \rightarrow Y$ is said to be strongly $g^{*} s$-continuous if the inverse image of every $\mathrm{g}^{*} \mathrm{~s}$ - open set in $Y$ is open in $X$.

Definition: 2.11[11] A topological space $X$ is $g * s$-compact if every $g^{*} s$-open cover of $X$ has a finite sub cover of $X$.
Definition: 2.12 [11] A subset B of a topological space $X$ is called $g^{*} s$-compact relative to $X$, if for every collection $\left\{A_{i}: i \in I\right\}$ of $g * s$-open subsets of $X$ such that $B \subseteq U_{i \in I} A_{i}$, there exist a finite subset $I_{o}$ of $I$ such that $B \subseteq U_{i \in I o} A_{i}$

Definition: 2.13[12] A topological space $X$ is called a $g^{*} s$-connected if $X$ cannot be written as a disjoint union of two non-empty g*s-open sets.

Definition: 2.14 [9] A space $X$ is said to be Hausdorff if whenever $x$ and $y$ are distinct points of $X$, there exist disjoint open sets U and V such that $x \in \mathrm{U}$ and $\mathrm{y} \in \mathrm{V}$.

Definition: 2.15[4] A bijection $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is called a homeomorphism if f is both continuous and open.
Definition: 2.16[4] A bijection $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is called a gs- homeomorphism if f is both gs-continuous and gs-open.

## 3. g*s-irresolute maps in topological spaces

In this section we introduce the concepts of $\mathrm{g}^{*}$ s-irresolute maps in topological spaces.
Definition: 3.1 A map $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is called $\mathrm{g}^{*}$ s -irresolute if the inverse image of every $\mathrm{g}^{*} \mathrm{~s}$-closed set in Y is $\mathrm{g}^{*}$ s-closed in X .

Theorem: 3.2 A map $f: X \rightarrow Y$ is $g^{*} s$-irresolute if and only if for every $g^{*} s$-open $A$ of $Y, f^{-1}(A)$ is $g^{*} s$-open in $X$.
Proof: Necessity: If $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\mathrm{g}^{*} \mathrm{~s}$-irresolute, then for every $\mathrm{g}^{*} \mathrm{~s}$-closed $B$ of $\mathrm{Y}, \mathrm{f}^{-1}(\mathrm{~B})$ is $\mathrm{g}^{*} \mathrm{~s}$-closed in X . If A is any $g^{*} s$-open subset of $Y$, then $A^{c}$ is $g^{*} s$-closed. Thus $f^{-1}\left(A^{c}\right)$ is $g^{*} s$-closed, but $f^{-1}\left(A^{c}\right)=\left(f^{-1}(A)\right)^{c}$ so that $f^{-1}(A)$ is $g^{*} s$-open in X .

Sufficiency: If for all $g^{*} s$-open subsets $A$ of $Y, f^{-1}(A)$ is $g * s$-open in $X$ and if $B$ is any $g^{*} s$-closed subset of $Y$, then $B^{c}$ is $g^{*} s$-open. Also $f^{-1}\left(B^{c}\right)=\left(f^{-1}(B)\right)^{c}$ is $g^{*} s$-open in $X$. Thus $f^{-1}(B)$ is $g^{*} s$-closed in $X$. Hence $f$ is $g^{*} s$-irresolute.

Theorem: 3.3 If a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\mathrm{g}^{*} \mathrm{~s}$-irresolute, then it is $\mathrm{g}^{*} \mathrm{~s}$-continuous.
Proof: Let A be a closed set in Y. Since every closed set is $\mathrm{g}^{*} \mathrm{~s}$-closed, A is $\mathrm{g}{ }^{*} \mathrm{~s}$-closed in Y. Since f is $\mathrm{g}^{*} \mathrm{~s}$-irresolute, $f^{-1}(A)$ is $g^{*} s$-closed in $X$. Hence $f$ is $g^{*} s$-continuous.

Remark: 3.4 The converse need not be true as seen from the following example.
Example: 3.5 Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\}\}$ and $\sigma=\{\phi, \mathrm{Y},\{\mathrm{a}\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be defined by $f(a)=f(c)=b$ and $f(b)=c$. Then $f$ is $g^{*} s$-continuous. However, $\{b\} g^{*} s$-closed in $Y$ but $f^{-1}(\{b\})=\{a, c\}$ is not $\mathrm{g}^{*} \mathrm{~s}$-closed in X . Therefore, f is not $\mathrm{g} \mathrm{s}_{\mathrm{s} \text {-irresolute. }}$

Theorem: 3.6 If $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ and $\mathrm{g}: \mathrm{Y} \rightarrow \mathrm{Z}$ are both $\mathrm{g} * \mathrm{~s}$-irresolute, then $\mathrm{g} \circ \mathrm{f}: \mathrm{X} \rightarrow \mathrm{Z}$ is $\mathrm{g}^{*} \mathrm{~s}$-irresolute.
Proof: Let A be a $g^{*} s$-open subset of Z. Since $g$ is $g^{*} s$-irresolute, $g^{-1}(A)$ is $g^{*} s$-open in Y. Since $f$ is $g * s$-irresolute, $f^{-1}\left(g^{-1}(A)\right)$ is $g^{*} s$-open in $X$. Thus $(g \circ f)^{-1}(A)=f^{-1}\left(g^{-1}(A)\right)$ is $g^{*} s$-open in $X$. Hence gof is $g^{*} s$-iresolute.

Theorem: 3.7 Let $\mathrm{X}, \mathrm{Y}$ and Z be any topological spaces. For any $\mathrm{g}^{*}$ s-irresolute map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ and any $\mathrm{g}^{*} \mathrm{~s}$-continuous map $\mathrm{g}: \mathrm{Y} \rightarrow \mathrm{Z}$, the composition $\mathrm{g} \circ \mathrm{f}: \mathrm{X} \rightarrow \mathrm{Z}$ is $\mathrm{g}^{*} \mathrm{~s}$-continuous.

## M. Perachi Sundari* and Latha Martin/

$g^{*}$ s-irresolute maps and $g^{*} s$ - homeomorphism in topological spaces/IJMA- 5(8), August-2014.
Proof: Let $F$ be a closed set in Z. Since $g$ is $g^{*} s$-continuous, $g^{-1}(F)$ is $g^{*} s$-closed in $Y$. Since $f$ is $g * s$-irresolute, $f^{-1}\left(g^{-1}(F)\right)$ is $g^{*} s$-closed in X. Thus $(g \circ f)^{-1}(F)=f^{-1}\left(g^{-1}(F)\right)$ is $g^{*} s$-closed in X. Hence gof is $g^{*} s$-continuous.

Theorem: 3.8 If a map $f: X \rightarrow Y$ is $g * s$-irresolute and a subset $B$ of $X$ is $g * s$-compact relative to $X$, then the image $f(B)$ is $\mathrm{g} * \mathrm{~s}$-compact relative to Y .

Proof: Let $\left\{A_{i}: i \epsilon I\right\}$ be any collection of $g^{*} s$-open subsets of $Y$ such that $f(B) \subset U\left\{A_{i}: i \epsilon I\right\}$. Then $B \subset \cup\left\{f^{-1}\left(A_{i}\right)\right.$ : $i \epsilon I\}$ holds. By hypothesis there exists a finite subset $I_{0}$ of $I$ such that $B \subset U\left\{f^{-1}\left(A_{i}\right)\right.$ : $\left.i \in I_{0}\right\}$. Therefore we have $f(B) \subset$ $U\left\{A_{i}: i \epsilon I_{0}\right\}$ which shows that $f(B)$ is $g^{*} s$-compact relative to $Y$.

Theorem: 3.9 If $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\mathrm{g}^{*} \mathrm{~s}$-irresolute surjection and X is $\mathrm{g}^{*} \mathrm{~s}$-connected, then Y is $\mathrm{g}^{*} \mathrm{~s}$-connected.
Proof: Suppose Y is not $\mathrm{g}^{*} \mathrm{~s}$-connected. Let $\mathrm{Y}=\mathrm{A} \cup \mathrm{B}$ where A and B are disjoint non-empty $\mathrm{g}^{*} \mathrm{~s}$-open set in Y. Since f is $g^{*} s$-irresolute and onto, $X=f^{-1}(A) \cup f^{-1}(B)$ where $f^{-1}(A)$ and $f^{-1}(B)$ are disjoint non-empty and $g^{*} s$-open in $X$. This contradicts the fact that X is $\mathrm{g}^{*} \mathrm{~s}$-connected. Hence Y is $\mathrm{g}^{*} \mathrm{~s}$-connected.

## 4. $g^{*} s$-Hausdorff in topological spaces

In this section we have introduce the concept of $\mathrm{g}^{*} \mathrm{~s}$-Hausdorff in topological spaces.
Definition: 4.1 A space X is said to be $\mathrm{g}^{*}$ s-Hausdorff if whenever x and y are distinct points of X , there exist disjoint $g^{*}$ s-open sets $U$ and $V$ such that $\mathrm{x} \in \mathrm{U}$ and $\mathrm{y} \epsilon \mathrm{V}$.

Theorem: 4.2 Let X be a space and Y be Hausdorff. If $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\mathrm{g}^{*} \mathrm{~s}$-continuous injective, then X is $\mathrm{g}^{*} \mathrm{~s}$-Hausdorff.
Proof: Let $x$ and $y$ be any two distinct points of X. Then $f(x)$ and $f(y)$ are distinct points of $Y$, because $f$ is injective. Since $Y$ is Hausdorff, there are disjoint open sets $U$ and $V$ in $Y$ containing $f(x)$ and $f(y)$, respectively. Since $f$ is $g^{*} s-$ continuous and $U \cap V=\varnothing$, we have $f^{-1}(U)$ and $f^{-1}(V)$ are disjoint $g^{*} s$-open sets in $X$ such that $x \in f^{-1}(U)$ and $y \in f^{-1}(V)$. Hence X is g *s-Hausdorff.

Theorem: 4.3 Let $X$ be a space and $Y$ be $g^{*} s$ - Hausdorff. If $f: X P$ is $g^{*} s$-irresolute injective, then $X$ is $g^{*} s-$ Hausdorff.

Proof: Let $x$ and $y$ be any two distinct points of $X$. Then $f(x)$ and $f(y)$ are distinct points of $Y$, because $f$ is injective. Since $Y$ is $g^{*} s$-Hausdorff, there are disjoint $g{ }^{*} s$-open sets $U$ and $V$ in $Y$ containing $f(x)$ and $f(y)$, respectively. Since $f$ is $g^{*} s$-irresolute and $U \cap V=\emptyset$, we have $f^{-1}(U)$ and $f^{-1}(V)$ are disjoint $g^{*} s$-open sets in $X$ such that $x \in f^{-1}(U)$ and $y \in f^{-1}(V)$. Hence X is $\mathrm{g}^{*} \mathrm{~s}$-Hausdorff.

Theorem: 4.4 Let $X$ be a space and $Y$ be $g^{*} s$-Hausdorff. If $f: X \rightarrow Y$ is strongly $g^{*} s$-continuous injective, then $X$ is Hausdorff.

Proof: Let $x$ and $y$ be any two distinct points of $X$. Then $f(x)$ and $f(y)$ are distinct points of $Y$, because $f$ is injective. Since $Y$ is $g^{*} s$-Hausdorff, there are disjoint $g^{*} s$-open sets $U$ and $V$ in $Y$ containing $f(x)$ and $f(y)$, respectively. Since $f$ is strongly $g^{*} s$-continuous and $U \cap V=\emptyset$, we have $f^{-1}(U)$ and $f^{-1}(V)$ are disjoint open sets in $X$ such that $x \in f^{-1}(U)$ and $y \in f^{-1}(V)$. Hence $X$ is Hausdorff.

## 5. g*s - Homeomorphism in topological spaces

In this section, we introduce and study two new homeomorphisms namely $\mathrm{g}^{*}$ s-homeomorphism, $\mathrm{g}^{*}$ sc-homeomorphism and prove that the set of all $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism forms a group under the operation of composition of maps.

Definition: 5.1 A bijection $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is called a $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism if f is both $\mathrm{g}^{*} \mathrm{~s}$-open and $\mathrm{g}^{*} \mathrm{~s}$-continuous. We denote the family of all $\mathrm{g}^{*} \mathrm{~s}$-homeomorphisms of a topological space $(\mathrm{X}, \tau)$ onto itself by $\mathrm{g} * \mathrm{~s}-\mathrm{h}(\mathrm{X}, \tau)$.

Theorem: 5.2 Every homeomorphism is a g*s-homeomorphism.
Proof: Let $\mathrm{f}(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a homeomorphism. To prove that f is $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism. Since f is homeomorphism, f is bijection and also f is both open and continuous. Since every open map is $\mathrm{g}^{*} \mathrm{~s}$-open and every continuous map is $\mathrm{g}^{*} \mathrm{~s}$-continuous, f is bijection, $\mathrm{g}^{*} \mathrm{~s}$-open and $\mathrm{g} * \mathrm{~s}$ - continuous. Hence f is $\mathrm{g} * \mathrm{~s}$-homeomorphism.

Remark: 5.3 The converse of the above theorem5.2 need not be true as seen from the following example.

Example: 5.4 Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi, \mathrm{X},\{\mathrm{a}, \mathrm{b}\}\}, \sigma=\{\phi, \mathrm{Y},\{\mathrm{a}\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a n identity map. Then $f$ is $g^{*} s$-homeomorphism but not homeomorphism. Since $\{a, b\}$ is open in $(X, \tau)$ but the image is not open in $(\mathrm{Y}, \sigma)$.

Theorem: 5.5 Every g*s-homeomorphism is gs-homeomorphism.
Proof: Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a $\mathrm{g}^{*} \mathrm{~s}$ - homeomorphism. To prove that f is gs-homeomorphism. Since f is $\mathrm{g}^{*} \mathrm{~s}$ homeomorphism, f is bijection and also f is both $\mathrm{g}^{*} \mathrm{~s}$-open and $\mathrm{g}^{*} \mathrm{~s}$-continuous. Since every $\mathrm{g}^{*} \mathrm{~s}$-open map is gs-open and every $\mathrm{g}^{*} \mathrm{~s}$-continuous map is gs-continuous, we have f is gs-open, gs- continuous and bijection. Hence f is gs-homeomorphism.

Remark: 5.6 The converse of the above theorem need not be true as seen from the following example.
Example: 5.7 Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi, \mathrm{X},\{\mathrm{a}\}\}, \sigma=\{\phi, \mathrm{Y},\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be an identity map. Then f is gs -homeomorphism but not $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism. Since $\{\mathrm{a}, \mathrm{b}\}$ is closed in $(\mathrm{Y}, \sigma) \operatorname{but}^{-1}(\{\mathrm{a}, \mathrm{b}\})$ $=\{a, b\}$ is not $g^{*} s$-closed in (X, $\left.\tau\right)$.

Theorem: 5.8 Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a bijective and $\mathrm{g} \mathrm{s}_{\mathrm{s}}$ continuous map, then the following are equivalent.
(i) $f$ is $\mathrm{g}^{*} \mathrm{~s}$-open map.
(ii) f is $\mathrm{g}{ }^{\mathrm{s} \text {-homeomorphism. }}$
(iii) f is $\mathrm{g}{ }^{\mathrm{s} \text {-closed map. }}$

## Proof:

(i) $\Rightarrow$ (ii): Suppose that $f$ is $g^{*} s$-open map. To prove that $f$ is $g^{*} s$-homeomorphism. By hypothesis, $f$ is bijective and $\mathrm{g}^{*} \mathrm{~s}$-continuous map. By definition of $\mathrm{g} * \mathrm{~s}$-homeomorphism, f is $\mathrm{g} * \mathrm{~s}$-homeomorphism.
(ii) $\Rightarrow$ (iii): Suppose that f is $\mathrm{g}^{*} \mathrm{~s}$ - homeomorphism. To prove that f is $\mathrm{g}^{*} \mathrm{~s}$ - closed map. Since f is $\mathrm{g}^{*} \mathrm{~s}$ homeomorphism, f is bijective and also f is $\mathrm{g}^{*} \mathrm{~s}$-open and $\mathrm{g}^{*} \mathrm{~s}$-continuous. Let F be a closed set of $(\mathrm{X}, \tau)$. Then $\mathrm{F}^{\mathrm{c}}$ is open set in $(X, \tau)$. Since $f$ is $g^{*} s$-open map, $f\left(F^{c}\right)$ is $g^{*} s$ - open in $(Y, \sigma) . f\left(F^{c}\right)=(f(F))^{c}$ is $g^{*} s$-open set in $(Y, \sigma)$. Thus $\mathrm{f}(\mathrm{F})$ is $\mathrm{g}^{*} \mathrm{~s}$-closed set in $(\mathrm{Y}, \sigma)$. Hence f is $\mathrm{g}^{*} \mathrm{~s}$-closed map.
(iii) $\Rightarrow$ (i): Suppose that $f$ is $g^{*} s$ - closed map. To prove that $f$ is $g^{*} s$ - open map. Let $A$ be a closed set in $(X, \tau)$. Since $f$ is $g^{*} s$-closed map, $f(A)$ is $g^{*} s$-closed set in $(Y, \sigma)$. $f(A)=\left(f^{-1}\right)^{-1}(A)$ is $g^{*} s$-closed set in $(Y, \sigma)$. Which implies $f^{-1}$ is $\mathrm{g}^{*} \mathrm{~s}$-continuous on ( $\mathrm{Y}, \sigma$ ).By theorem 2.7, f is $\mathrm{g}^{*} \mathrm{~s}$-open map.

Remark: 5.9 The composition of two $\mathrm{g}^{*}$ s-homeomorphism need not be $\mathrm{g}^{*}$ s-homeomorphism in general as seen from the following example. Consider $\mathrm{X}=\mathrm{Y}=\mathrm{Z}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}, \sigma=\{\phi, \mathrm{Y},\{\mathrm{a}, \mathrm{b}\}\}$ and $\eta=\{\phi, \mathrm{Z}$, $\{\mathrm{a}\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ and $\mathrm{g}:(\mathrm{Y}, \sigma) \rightarrow(\mathrm{Z}, \eta)$ be the identity maps. Then both f and g are $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism but their composition $g \circ f:(X, \tau) \rightarrow(Z, \eta)$ is not $g^{*} s$-homeomorphism. Because for the open set $\{b\}$ of $(X, \tau), g \circ f(\{b\})=$ $g(f(\{b\}))=g(\{b\})=\{b\}$ which is not $g^{*} s$-open in $(Z, \eta)$.

Definition: 5.10 A bijection $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is said to be $\mathrm{g}^{*} \mathrm{sc}$ - homeomorphism if both f and $\mathrm{f}^{-1}$ are $\mathrm{g}^{*} \mathrm{~s}$-irresolute. We denote the family of all $\mathrm{g} *$ sc-homeomorphism of a topological space ( $\mathrm{X}, \tau$ ) onto itself by $\mathrm{g} * \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau)$.

Theorem: 5.11 Every g *sc-homeomorphism is $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism.
Proof: Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a $\mathrm{g}^{*} \mathrm{sc}$ - homeomorphism. To prove that f is $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism. That is, to prove that $f$ is bijective and also $f$ is both $g^{*} s$-open and $g^{*} s$-continuous. Since $f$ is $g^{*} s c$-homeomorphism, $f$ and $f^{-1}$ are $g^{*} s$ irresolute and $f$ is bijective. Now, let $V$ be a closed set in $(Y, \sigma)$. Since $f$ is $g^{*} s$-irresolute, $f^{-1}(V)$ is $g^{*} s$-closed in $(X, \tau)$. Thus $f$ is $g^{*} s$-continuous. Since $f^{-1}$ is $g^{*} s$-irresolute, $\left(f^{-1}\right)^{-1}(V)$ is $g^{*} s$-closed in $(X, \tau)$.Therefore $f^{-1}$ is $g^{*} s$-continuous. By theorem 2.7, f is $\mathrm{g}^{*} \mathrm{~s}$-open. Hence f is $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism.

Remark: 5.12 The converse of the above theorem need not be true as seen from the following example.
Example: 5.13 Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi, \mathrm{X},\{\mathrm{a}\}\}, \sigma=\{\phi, \mathrm{Y},\{\mathrm{a}, \mathrm{b}\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be an identity map. Then f is $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism but not $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism. Since f is not $\mathrm{g}^{*} \mathrm{~s}$-irresolute, the inverse image of $\{\mathrm{a}, \mathrm{c}\}$ is not $\mathrm{g} * \mathrm{~s}$-closed set in (X, $\tau)$.

Theorem: 5.14 Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ and $\mathrm{g}:(\mathrm{Y}, \sigma) \rightarrow(\mathrm{Z}, \eta)$ are $\mathrm{g}^{*} \mathrm{sc}$ - homeomorphism. Then their composition $\mathrm{g} \circ \mathrm{f}:$ $(\mathrm{X}, \tau) \rightarrow(\mathrm{Z}, \eta)$ is also $\mathrm{g}^{*}$ sc-homeomorphism.

## M. Perachi Sundari* and Latha Martin/

Proof: Let $U$ be a $g^{*} s$-open set in $(Z, \eta)$. Since $g$ is $g^{*} s$-irresolute, $g^{-1}(U)$ is $g *_{s}$-open in $(Y, \sigma)$. Since $f$ is $g^{*} s$-irresolute, $f^{-1}\left(g^{-1}(U)\right)=(g \circ f)^{-1}(U)$ is $g^{*} s$-open in $(X, \tau)$.Therefore, gof is $g^{*} s$-irresolute. Also for a $g^{*} s$-open set $G$ in $(X, \tau)$. We have $(g \circ f)(G)=g(f(G))=g(W)$, where $W=f(G)$. By hypothesis, $f(G)$ is $g^{*} s$-open in $(Y, \sigma)$ and so again by hypothesis, $g(f(G))$ is $g^{*} s$-open set in $(Z, \eta)$. $(\mathrm{g} \circ f)(G)$ is $\mathrm{g}^{*} \mathrm{~s}$-open set in $(\mathrm{Z}, \eta)$. ( $\left.\mathrm{g} \circ \mathrm{f}\right)^{-1}$ is $\mathrm{g}^{*} \mathrm{~s}$-irresolute and also gof is bijective. Hence gof is $\mathrm{g} * \mathrm{sc}$-homeomorphism.

Remark: 5.15 The following diagram shows that the relationships between $\mathrm{g}^{*} \mathrm{~s}$-homeomorphism and other homeomorphism.

Note: 5.16 Let $\Gamma$ be a collection of all topological spaces. We introduce a relation, sa " $\mathrm{g}^{*} s \mathrm{sc}$ ", into the family $\Gamma$ as follows: for two elements $(\mathrm{X}, \tau)$ and $(\mathrm{Y}, \sigma)$ of $\Gamma,(\mathrm{X}, \tau)$ is $\mathrm{g}^{*} \mathrm{sc}$ - homeomorphic to $(\mathrm{Y}, \sigma)$ say $(\mathrm{X}, \tau) \equiv \mathrm{g}^{*} \mathrm{sc}(\mathrm{Y}, \sigma)$, if there exists a $\mathrm{g}^{*} \mathrm{sc}$ - homeomorphism $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$.Then we have the following theorem on the relation " $\equiv_{\mathrm{g}^{* s c}}$ ".

Theorem: 5.17 The relation $\equiv_{\mathrm{g}^{* s c}}$ above is an equivalence relation in the collection of all topological spaces $\Gamma$.

## Proof:

(i) For any element $(X, \tau) \in \Gamma,(X, \tau) \equiv_{g^{*} s c}(X, \tau)$ holds. Indeed the identity function $I_{x}:(X, \tau) \rightarrow(X, \tau)$ is a $g^{*}$ schomeomorphism.
(ii) Suppose $(\mathrm{X}, \tau) \equiv_{\mathrm{g}^{* s c}}(\mathrm{Y}, \sigma)$, where $(\mathrm{X}, \tau)$ and $(\mathrm{Y}, \sigma) \in \Gamma$. Then, there exists a $\mathrm{g}^{*}$ sc-homeomorphism $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow$ $(\mathrm{Y}, \sigma)$. By definition it is seen that $\mathrm{f}^{-1}:(\mathrm{Y}, \sigma) \rightarrow(\mathrm{X}, \tau)$ is a $\mathrm{g}^{*}$ sc-homeomorphism and $(\mathrm{Y}, \sigma) \equiv_{\mathrm{g}^{* s c}}(\mathrm{X}, \tau)$.
(iii) Suppose that $(\mathrm{X}, \tau) \equiv_{\mathrm{g}^{* s c}}(\mathrm{Y}, \sigma)$ and $(\mathrm{Y}, \sigma) \equiv_{\mathrm{g}^{* s c}}(\mathrm{Z}, \eta)$, where $(\mathrm{X}, \tau),(\mathrm{Y}, \sigma)$ and $(\mathrm{Z}, \eta) \in \Gamma$. By theorem 5.13, it is shown that $(X, \tau) \equiv{ }_{\mathrm{g}^{* s c}}(Z, \eta)$.

Theorem: 5.18 The set $\mathrm{g}^{*} \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau)$ is a group under the composition of maps.
Proof: Define a binary operation $*: g * s c-h(X, \tau) \times g * s c-h(X, \tau) \rightarrow g * s c-h(X, \tau)$ by $f * g=g \circ f$ for all $f, g \in g^{*} s c-h(X, \tau)$ and $\circ$ is the usual operation of composition of maps. Then by theorem $5.13, \mathrm{~g} \circ \mathrm{f} \in \mathrm{g}^{*} \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau)$. We know that the composition of maps is associative and the identity map I: (X, $\rightarrow() \mathrm{X}, \tau)$ belonging to $\mathrm{g} * \mathrm{sc} \quad-\mathrm{h}(\mathrm{X}, \tau)$ serves as the identity element. If $f \in g^{*} \operatorname{sc}-h(X, \tau)$, then $f^{-1} \in g^{*} s c-h(X, \tau)$ such that $f \circ f^{-1}=f^{-1} \circ f=I$ and so inverse exists for each element of $\mathrm{g} * \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau)$. Therefore $(\mathrm{g} * \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau), \circ$ ) is a group under the operation of composition of maps.

Theorem: 5.19 Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a $\mathrm{g} * \mathrm{sc}$-homeomorphism. Then f induces an isomorphism from the group g *c$h(X, \tau)$ onto the group $\mathrm{g}^{*} \mathrm{sc}-\mathrm{h}(\mathrm{Y}, \sigma)$.

Proof: Let $f \in g^{*} \operatorname{sc}-\mathrm{h}(\mathrm{X}, \tau)$. Then define a map $\psi_{\mathrm{f}}: \mathrm{g}^{*} \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau) \rightarrow \mathrm{g}^{*} \mathrm{sc}-\mathrm{h}(\mathrm{Y}, \sigma)$ by $\psi_{\mathrm{f}}(\mathrm{h})=\mathrm{f} \circ \mathrm{h} \circ \mathrm{f}^{-1}$ for every $\mathrm{h} \in \mathrm{g}^{*} \mathrm{sc}-$ $\mathrm{h}(\mathrm{X}, \tau)$. By theorem 5.13, $\psi_{\mathrm{f}}$ is well defined in general, because fo $\mathrm{h} \circ \mathrm{f}^{-1}$ is a $\mathrm{g}^{*}$ sc-homeomorphism for every $\mathrm{g}^{*}$ schomeomorphism h: $(X, \tau) \rightarrow(Y, \sigma)$. Let $h_{1}, \mathrm{~h}_{2} \in \mathrm{~g}^{*} \mathrm{sc}-\mathrm{h}(\mathrm{X}, \tau)$. Then $\psi_{\mathrm{f}}\left(\mathrm{h}_{1} \circ \mathrm{~h}_{2}\right)=\mathrm{f} \circ\left(\mathrm{h}_{1} \circ \mathrm{~h}_{2}\right) \circ \mathrm{f}^{-1}=\left(\mathrm{f} \circ \mathrm{h}_{1} \circ \mathrm{f}^{-1}\right) \circ\left(\mathrm{f} \circ \mathrm{h}_{2} \circ \mathrm{f}^{-1}\right)$ Therefore $\psi_{f}\left(h_{1} \circ h_{2}\right)=\psi_{f}\left(h_{1}\right) \circ \psi_{f}\left(h_{2}\right)$. Since $\psi_{f}\left(f^{-1} \circ h \circ f\right)=h, \psi_{f}$ is onto. Now, $\psi_{f}(h)=I$ implies fohof $f^{-1}=I$. That implies $\mathrm{h}=\mathrm{I}$. This proves that $\psi_{\mathrm{f}}$ is one-one. This shows that $\psi_{\mathrm{f}}$ is an isomorphism induced by f.

Theorem: 5.20 If $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is a $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism, then $\mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}\left(\mathrm{f}^{-1}(\mathrm{~B})\right)=\mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{B})\right)$ for every $\mathrm{B} \subseteq \mathrm{Y}$.
Proof: Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a $\mathrm{g}^{*}$ sc -homeomorphism. By definition 5.9 , both f and $\mathrm{f}^{-1}$ are $\mathrm{g}^{*} \mathrm{~s}$-irresolute and f is bijective. Let $\mathrm{B} \subseteq \mathrm{Y}$. Since $\mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{B})$ is a $\mathrm{g}^{*} \mathrm{~s}$-closed set in $(\mathrm{Y}, \sigma)$, using definition of $\mathrm{g}^{*} \mathrm{~s}$-irresolute, $\mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{B})\right)$ is $g^{*} s-c l o s e d ~ i n ~(X, \tau)$. But $g^{*} s-c l\left(f^{-1}(B)\right)$ is the smallest $g^{*} s$-closed set containing $f^{-1}(B)$.Therefore $g^{*} s-c l\left(f^{-1}(B)\right) \subseteq f^{-1}\left(g^{*} s-\right.$ $\mathrm{cl}(\mathrm{B})) \rightarrow(1)$. Again, $\mathrm{g}^{*} \mathrm{~s}$-cl( $\left(\mathrm{f}^{-1}(\mathrm{~B})\right)$ is $\mathrm{g}^{*} \mathrm{~s}$-closed in $(\mathrm{X}, \tau)$. Since $\mathrm{f}^{1}$ is $\mathrm{g}^{*} \mathrm{~s}$-irresolute, $\mathrm{f}\left(\mathrm{g}^{*} \mathrm{~s}\right.$-cl( $\mathrm{f}^{-1}(\mathrm{~B})$ ) is $\mathrm{g}^{*} \mathrm{~s}$-closed in $(Y, \sigma)$. Now, $B=f\left(f^{-1}(B)\right) \subseteq f\left(g^{*} S-c l\left(f^{-1}(B)\right)\right.$. Since $f\left(g^{*} s-c l\left(f^{-1}(B)\right)\right.$ is $g^{*} s-c l o s e d ~ a n d ~ g * s-c l(B)$ is the smallest $g^{*} s-$ closed set containing $B, g^{*} s-c l(B) \subseteq f\left(g^{*} s-c l\left(f^{-1}(B)\right)\right.$ that implies $\mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{B})\right) \subseteq \mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}\left(\mathrm{f}^{-1}(\mathrm{~B})\right)$. That is, $\mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\right.$ $\mathrm{cl}(\mathrm{B})) \subseteq \mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}\left(\mathrm{f}^{-1}(\mathrm{~B})\right) \rightarrow(2)$. From (1) and (2), $\mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}\left(\mathrm{f}^{-1}(\mathrm{~B})\right)=\mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{B})\right)$.

## M. Perachi Sundari* and Latha Martin/

$g^{*}$ s-irresolute maps and $g^{*} s$ - homeomorphism in topological spaces/IJMA- 5(8), August-2014.
Corollary: 5.21 If $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is a $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism, then $\mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{f}(\mathrm{B}))=\mathrm{f}\left(\mathrm{g}^{*} \mathrm{~s}-\mathrm{cl}(\mathrm{B})\right)$ for every $\mathrm{B} \subseteq \mathrm{X}$.
Proof: Let $\mathrm{f}:(\mathrm{X}, \tau)(\mathrm{Y}, \sigma)$ be a $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism. Since f is $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism, $\mathrm{f}^{-1}$ is also a $\mathrm{g}^{*} \mathrm{sc}$ homeomorphism. Therefore by theorem 5.20, it follows that $g^{*} s-c l(f(B))=f(g * s-c l(B))$ for every $B \subseteq X$.

Corollary: 5.22 If $f:(X, \tau) \rightarrow(Y, \sigma)$ is a $g^{*} s c$-homeomorphism, then $f\left(g^{*} s-i n t(B)\right)=g^{*} s-i n t(f(B))$ for every $B \subseteq X$.
Proof: Let $f:(X, \tau) \rightarrow(Y, \sigma)$ be a $g^{*} s c-h o m e o m o r p h i s m$. For any set $B \subseteq X, g^{*} s-i n t(B)=\left(g^{*} s-c l\left(B^{c}\right)\right)^{c}$. This implies that $f$ $\left(g^{*} s-\operatorname{int}(B)\right)=f\left(g^{*} s-c l\left(B^{c}\right)\right)^{c}=\left(f\left(g^{*} s-c l\left(B^{c}\right)\right)^{c}\right.$. Then using corollary 5.22 , we get that $f\left(g^{*} s-i n t(B)=\left(g^{*} s-c l\left(f\left(B^{c}\right)\right)^{c}\right.\right.$ $=g^{*} s-\operatorname{int}(f(B))$.

Corollary: 5.23 If $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is a $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism, then for every $\mathrm{B} \subseteq \mathrm{Y}, \mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\mathrm{int}(\mathrm{B})\right)=\mathrm{g}^{*} \mathrm{~s}-\mathrm{int}\left(\mathrm{f}^{-1}(\mathrm{~B})\right)$.
Proof: Let $\mathrm{f}:(\mathrm{X}, \tau)(\mathrm{Y}, \sigma)$ be a $\mathrm{g}^{*}$ sc -homeomorphism. Since f is $\mathrm{g}^{*} \mathrm{sc}$-homeomorphism, $\mathrm{f}^{-1}$ is also a $\mathrm{g}^{*} \mathrm{sc}$ homeomorphism. Therefore by corollary 5.22, it follows that $\mathrm{f}^{-1}\left(\mathrm{~g}^{*} \mathrm{~s}-\mathrm{int}(\mathrm{B})\right)=\mathrm{g}^{*} \mathrm{~s}$-int $\left(\mathrm{f}^{-1}(\mathrm{~B})\right)$ for every $\mathrm{B} \subseteq \mathrm{Y}$.
