#### Abstract

The degree of approximation of $f(x)$, conjugate of a function $f \in$ almost lip $\alpha$, by ( $N, p, q$ ) (E,q) means of the conjugate series is determined.

Keywords: Almost Lipschitz function; Degree of Approximation; ( $N, p, q$ ) means; ( $E, q$ ) means; conjugate series.

## 1. INTRODUCTION AND DEFINITIONS

The degree of approximation by Cesaro means and by Nörlund means of the Fourier series of a function $f \in \operatorname{Lip} \alpha$ have been studied by Alexits [1], Sahney and Goel [8], Chandra [3], Qureshi ([4], [5]), and Qureshi and Neha [7], But till now no work seems to have been done to obtain the degree of approximation of $f(x)$, conjugate of a function $f \in L^{a}$ ip $\alpha$, by product of generalized Nörlund mean ( $N, p, q$ ) and Euler's means of order q, ( $\mathrm{E}, \mathrm{q}$ ) in an attempt to make an advance study in this direction, the object of this paper is to determine the degree of approximation of conjugates of almost Lipschitz functions by ( $\mathrm{N}, \mathrm{p}, \mathrm{q}$ ) ( $\mathrm{E}, \mathrm{q}$ ) means of the conjugate series of the Fourier series.

Let $f(x)$ be a function with period $2 \pi$ and integrable in the sense of Lebesgue over $(-\pi, \pi)$. Let its Fourier series be given by

$$
\mathrm{f}(\mathrm{x}) \sim \frac{1}{2} \mathrm{a}_{0}+\sum_{\mathrm{n}=1}^{\infty}\left(\mathrm{a}_{\mathrm{n}} \cos \mathrm{nx}+\mathrm{b}_{\mathrm{n}} \sin \mathrm{nx}\right)=\frac{1}{2} \mathrm{a}_{0}+\sum_{\mathrm{n}=1}^{\infty} \mathrm{A}_{\mathrm{n}}(\mathrm{x})
$$

Then
$\sum_{n=1}^{\infty}\left(a_{n} \sin n x-b_{n} \cos n x\right)=-\sum_{n=1}^{\infty} B_{n}(x)$
is called the conjugate series of Fourier series.
The degree of approximation of a function $f: R \rightarrow R$ by a trigonometric polynomial $t_{n}$ of order $n$ is defined by Zygmund [9]

$$
\left\|\mathrm{t}_{\mathrm{n}}-\mathrm{f}\right\|_{\infty}=\sup \left\{\mathrm{t}_{\mathrm{n}}(\mathrm{x})-\mathrm{f}(\mathrm{x}) \mid: \mathrm{x} \in \mathrm{R}\right\}
$$

Let $0<\alpha \leq 1$ and let $\mathrm{f}: \mathrm{R} \rightarrow \mathrm{R}$ be almost Lipschitz of order $\alpha, \mathrm{f} \in \mathrm{L}^{\mathrm{a}}$ ip $\alpha$, in the sense that there is a constant $M=M_{f} \geq 0$ and for each $x \in R$; there is a subset $A_{x} \subset\left[0, \frac{\pi}{2}\right]$ of measure zero, such that $t \in\left[0, \frac{\pi}{2}\right] / A_{x}$ implies $|f(x+2 t)-f(x-2 t)| \leq M t^{\alpha}$

Every Lip $\alpha$ function is trivially $\mathrm{L}^{\mathrm{a}}$ ip $\alpha$, but the class $\mathrm{L}^{\mathrm{a}}$ ip $\alpha$ greatly extends the class Lip $\alpha$. For example, let g denote the characteristic function of the irrationals, Take $A_{x}=\left\{t \in\left[0, \frac{\pi}{2}\right]\right.$ : at least one of $(x+2 t)$ and $(x-2 t)$ is rational $\}$.

[^0]So that $A_{x}$ being countable has measure zero. For each $x$ and $t \in\left[0, \frac{\pi}{2}\right] / A x$, both $(x+2 t)$ and $(x-2 t)$ are irrational and so $|g(x+2 t)-g(x-2 t)|=0$. Hence $g$ is $L^{a}$ ip $\alpha$ for every $\alpha$. But obviously $g$ is not Lipschitz of any non-zero order.

For $0<t \leq \frac{\pi}{2}$, Since $\sin t \geq \frac{2 t}{\pi}$
so for each $x \in R$, we have

$$
\left|\psi_{\mathrm{x}}(\mathrm{t}) \cos \mathrm{t}\right| \leq \mathrm{Mt}^{\alpha} \frac{\pi}{2 \mathrm{t}}=\mathrm{M} \frac{\pi}{2} \mathrm{t}^{\alpha-1}, \mathrm{t} \in\left[0, \frac{\pi}{2}\right] \backslash \mathrm{A}_{\mathrm{x}}
$$

where $\psi_{\mathrm{x}}(\mathrm{t})=\mathrm{f}(\mathrm{x}+2 \mathrm{t})-\mathrm{f}(\mathrm{x}-2 \mathrm{t})$.
Since $A_{x}$ has measure zero, it follows at once that $f$ has its conjugate function $f$, zygmund [9] defined and finite for each $x \in R$ by the improper Lebesgue integral
$\tilde{\mathrm{f}}(\mathrm{x})=\frac{-1}{\pi} \int_{0}^{\pi / 2} \psi_{\mathrm{x}}(\mathrm{t}) \cot \mathrm{tdt}=-\frac{1}{\pi} \lim _{\epsilon \rightarrow 0_{+}} \int_{\epsilon}^{\pi / 2} \psi_{\mathrm{x}}(\mathrm{t}) \cot \mathrm{tdt}$.

If $(E, q)=E_{n}^{q}=\frac{1}{(1+q)^{n}} \sum_{k=0}^{n}\binom{n}{k} q^{n-k} s_{k} \rightarrow s$ as $n \rightarrow \infty$ then the infinite series $\sum_{n=0}^{\infty} \mathrm{u}_{\mathrm{n}}$ is said to be summable (E, q) to a definite number s. Hardy [4].
For two sequences $\left\{p_{n}\right\}$ and $\left\{q_{n}\right\}$, we write $t_{n}^{p, q}=\frac{1}{R_{n}} \sum_{k=0}^{n} p_{n-k} q_{k} s_{k}$,
$R_{n}=\sum_{k=0}^{n} p_{k} q_{n-k} \neq 0$ for all $n$, then the generalized, Nörlund transformation of the sequence $\left\{s_{n}\right\}$ is the sequence $\left\{\mathrm{t}_{\mathrm{n}}{ }^{\mathrm{p}, \mathrm{q}}\right\}$. If $\mathrm{t}_{\mathrm{n}}{ }^{\mathrm{p}, \mathrm{q}} \rightarrow \mathrm{s}$ as $\mathrm{n} \rightarrow \infty$, then the series $\sum_{\mathrm{n}=0}^{\infty} \mathrm{u}_{\mathrm{n}}$ or the sequence $\left\{\mathrm{s}_{\mathrm{n}}\right\}$ is said to be summable to s by generalized Nörlund method ( $\mathrm{N}, \mathrm{p}, \mathrm{q}$ ) and is denoted by $\mathrm{s}_{\mathrm{n}} \rightarrow \mathrm{s}(\mathrm{N}, \mathrm{p}, \mathrm{q})$ Borwein [2].

The necessary and sufficient conditions for a ( $\mathrm{N}, \mathrm{p}, \mathrm{q}$ ) method to be regular are

$$
\sum_{k=0}^{n}\left|p_{n-k} q_{k}\right|=O\left(\left|R_{n}\right|\right) \text { and } \mathrm{p}_{\mathrm{n}-\mathrm{k}}=\mathrm{o}\left(\left|\mathrm{R}_{\mathrm{n}}\right|\right) \text { as } \mathrm{n} \rightarrow \infty \text {, for every fixed } \mathrm{k} \geq 0 \text { for which } \mathrm{q}_{\mathrm{k}} \neq 0
$$

The product of the ( $N, p, q$ ) summability with a (E, q) summability defines the ( $N, p, q$ ) (E, q). Thus the ( $N, p, q$ ) (E, q) transform of $\left\{\mathrm{s}_{\mathrm{n}}\right\}$ is given by

$$
\begin{aligned}
& =\frac{1}{R_{n}} \sum_{k=0}^{n} p_{n-k} q_{k} E_{k}^{q} \\
& =\frac{1}{R_{n}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{k}} q_{\mathrm{n}-\mathrm{k}} \mathrm{E}_{\mathrm{n}-\mathrm{k}}^{\mathrm{q}} \\
& =\frac{1}{\mathrm{R}_{\mathrm{n}}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{n}-\mathrm{k}} q_{\mathrm{k}} \frac{1}{(1+\mathrm{q})^{k}} \sum_{\mathrm{r}=0}^{\mathrm{k}}\binom{\mathrm{k}}{\mathrm{r}} \mathrm{q}^{\mathrm{k}-\mathrm{r}} \mathrm{~s}_{\mathrm{r}}
\end{aligned}
$$

If the (N, p, q) (E, q) transform of $\left\{s_{n}\right\} \rightarrow s$, as $n \rightarrow \infty$ then the series $\sum_{n=0}^{\infty} u_{n}$ or the sequence $\left\{s_{n}\right\}$ is said to be summable to the sum s by $(N, p, q)(E, q)$ method and we write the $(N, p, q)(E, q)$ transform of $\left\{s_{n}\right\} \rightarrow s(N, p, q)(E$, q), as $n \rightarrow \infty$ we shall use following notations.

$$
\begin{aligned}
& \tilde{N}_{n}(t)=\frac{1}{\pi R_{n}} \sum_{k=0}^{n} p_{k} q_{n-k}\left(\frac{\cos ^{n-k} t \cos (n-k+1) t}{\sin t}\right) \\
& \tau=\left[\frac{1}{t}\right]=\text { int egral part of } \frac{1}{t} .
\end{aligned}
$$

## 2. THEOREM

Let ( $\mathrm{N}, \mathrm{p}, \mathrm{q}$ ) be a regular generalized Nörlund method generated by non-negative, monotonic non-increasing sequence $\left\{p_{n}\right\}$ and $\left\{q_{n}\right\}$ of real constants such that

$$
\mathrm{R}_{\mathrm{n}}=\sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{k}} \mathrm{q}_{\mathrm{n}-\mathrm{k}} \neq 0 . \text { If } \mathrm{f}: \mathrm{R} \rightarrow \mathrm{R} \text { is } 2 \pi
$$

periodic Lebesgel integrable on $[-\pi, \pi]$ and is almost Lipschitz function of order $\alpha, 0<\alpha \leq 1, f \in L^{a}$ ip $\alpha$, then the degree of approximation of the conjugate $\tilde{f}$ by ( $N, p, q$ ) (E, q) product means $=\frac{1}{R_{n}} \sum_{k=0}^{n} p_{n-k} q_{k} \frac{1}{(1+q)^{k}} \sum_{r=0}^{k} q^{k-r} \tilde{S}_{r}$ of the conjugate series of Fourier series (1) is given by

$$
\left\|\frac{1}{R_{n}} \sum_{k=0}^{n} p_{n-k} q_{k} \frac{1}{(1+q)^{k}} \sum_{r=0}^{k}\binom{k}{r} q^{k-r} \tilde{s}_{r}-\tilde{f}\right\|_{\infty}=\left\{\begin{array}{l}
0\left(\frac{1}{n^{\alpha}}\right), 0<\alpha<1 \\
0\left(\frac{\log n \pi e}{n}\right), \alpha=1
\end{array}\right.
$$

## 3. LEMMA

For the proof of the theorem we require the following lemma:
Lemma: Let $\tilde{N}_{n}(t)$ be given by (2), then $\tilde{N}_{n}(t)=0\left(\frac{R_{\tau}}{t R_{n}}\right), \frac{1}{n}<t \leq \frac{\pi}{2}$

Proof: for $\frac{1}{n}<t \leq \frac{\pi}{2}$, $\sin t \geq \frac{2 t}{\pi}$, then

$$
\begin{aligned}
\left|\tilde{N}_{n}(t)\right| & \left.\leq \frac{1}{2 t R_{n}} \right\rvert\, \sum_{k=0}^{\tau-1} p_{k} q_{n-k} \cos ^{n-k}(t) \cos (n-k+1) t+\sum_{k=t}^{n} p_{k} q_{n-k} \cos ^{n-k}(t) \cos (n-k+1 t \mid \\
& \leq \frac{1}{2 t R_{n}}\left[\sum_{k=0}^{\tau-1} p_{k} q_{n-k}\left|\cos ^{n-k}(t) \cos (n-k+1) t\right|+\sum_{k=t}^{n} p_{k} q_{n-k} \mid \cos ^{n-k}(t) \cos (n-k+1 t \mid]\right. \\
& \leq \frac{1}{2 t R_{n}}\left[\sum_{k=0}^{\tau-1} p_{k} q_{n-k}+2 p_{s} q_{o} \max \left\lvert\, \frac{\cos \left(\frac{3 n-2 \tau-1}{2}\right) \sin \frac{n t}{2}}{\sin \frac{t}{2}}\right.\right] \\
& \leq \frac{1}{2 t R_{n}}\left[\sum_{k=0}^{\tau-1} p_{k} q_{n-k}+O\left(\frac{p_{\tau} q_{0}}{t}\right)\right]
\end{aligned}
$$

Since $\sum_{k=0}^{\tau-1} \mathrm{P}_{\mathrm{k}} \mathrm{P}_{\mathrm{n}-\mathrm{k}} \leq \mathrm{R}_{\tau}$ and $\frac{\mathrm{p}_{\tau} \mathrm{q}_{\mathrm{o}}}{\mathrm{t}} \leq \mathrm{P}_{\tau} \mathrm{Q}_{\tau} \leq \mathrm{R}_{\tau}$
where $\mathrm{R}_{\tau}=\sum_{\mathrm{k}=0}^{\tau} \mathrm{p}_{\mathrm{k}} \mathrm{q}_{\tau-\mathrm{k}}$, therefore

$$
\tilde{\mathrm{N}}_{\mathrm{n}}(\mathrm{t})=\mathrm{O}\left(\frac{\mathrm{R}_{\tau}}{\mathrm{tR}_{\mathrm{n}}}\right)
$$

## 4. PROOF OF THE THEOREM

$r^{\text {th }}$ partial sum, $\widetilde{S}_{r}(x)$, of the conjugate series (1) can be written as
$\tilde{\mathrm{S}}_{\mathrm{r}}(\mathrm{x})=\tilde{\mathrm{f}}(\mathrm{x})+\frac{1}{\pi} \int_{0}^{\pi / 2} \psi_{\mathrm{x}}(\mathrm{t}) \frac{\cos (2 \mathrm{r}+1)^{\mathrm{t}}}{\sin \mathrm{t}} \mathrm{dt}$
So the (E, q) means of the $\widetilde{S}_{r}(x)$ are

$$
\begin{aligned}
E_{k}^{q} & =\frac{1}{(1+q)^{k}} \sum_{r=0}^{k}\binom{k}{r} q^{k-r} \tilde{S}_{r}(x), r=0,1,2, . . \\
& =\frac{q^{k-r}}{(1+q)^{k}} \sum_{r=0}^{k}\binom{k}{r}\left[\tilde{f}(x)+\frac{1}{\pi} \int_{0}^{\pi / 2} \psi_{x}(t) \frac{\cos (2 r+1) t}{\sin t} d t\right] \\
& =\tilde{f}(x)+\frac{q^{k-r}}{\pi(1+q)^{k}} \int_{0}^{\pi / 2} \frac{\psi_{x}(t)}{\sin t} \sum_{r-0}^{k}\binom{k}{r} \cos (2 r+1)_{t} d t
\end{aligned}
$$

$$
\mathrm{E}_{\mathrm{k}}^{\mathrm{q}}(\mathrm{x})-\tilde{\mathrm{f}}(\mathrm{x})=\frac{\mathrm{q}^{\mathrm{k}-\mathrm{r}}}{\pi(1+\mathrm{q})^{\mathrm{k}}} \int_{0}^{\pi / 2} \frac{\psi_{\mathrm{x}}(\mathrm{t})}{\sin \mathrm{t}} \sum_{\mathrm{r}=0}^{\mathrm{k}}\binom{\mathrm{k}}{\mathrm{r}} \cos (2 \mathrm{r}+1) \mathrm{t} \mathrm{dt}
$$

$$
=\frac{q^{k-r}}{\pi(1+q)^{k}} \int_{0}^{\pi / 2} \frac{\psi_{x}(t)}{\sin t}\left[\operatorname{Re}\left[\sum_{r=0}^{k}\binom{k}{r} e^{i}(2 r+1) t\right]\right] d t
$$

$$
=\frac{q^{k-r}}{\pi(1+q)^{k}} \int_{0}^{\pi / 2} \frac{\psi_{x}(t)}{\sin t}\left(\operatorname{Re}\left[\sum_{r=0}^{k}\binom{k}{r} e^{i 2 r t} e^{i t}\right]\right) d t
$$

$$
=\frac{q^{k-r}}{\pi(1+q)^{k}} \int_{0}^{\pi / 2} \frac{\psi_{x}(t)}{\sin t}\left(\operatorname{Re}\left[\left(1+e^{2 i t}\right)^{k} e^{i t}\right]\right) d t
$$

$$
=\frac{q^{k-r}}{\pi(1+q)^{k}} \int_{0}^{\pi / 2} \frac{\psi_{x}(t)}{\sin t}\left(2^{k} \cos ^{k} t \cos k t \cos t\right) d t
$$

$$
=\frac{q^{k-r} 2^{k}}{\pi(1+q)^{k}} \int_{0}^{\pi / 2} \frac{\psi_{x}(t)}{\sin t}\left(\cos ^{k} t \cos (k+1) t\right) d t
$$

Now,

$$
\begin{align*}
& \frac{1}{R_{n}} \sum_{k=0}^{n} p_{k} q_{n-k}\left[E_{n-k}^{q}(x)-\tilde{f}(x)\right] \\
&=\frac{1}{R_{n}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{k}} q_{\mathrm{n}-\mathrm{k}}\left[\frac{\mathrm{q}^{\mathrm{n}-\mathrm{k}-\mathrm{r}} 2^{\mathrm{n}-\mathrm{k}}}{\pi(1+\mathrm{q})^{\mathrm{n}-\mathrm{k}}} \int_{0}^{\pi / 2} \frac{\psi_{\mathrm{x}}(\mathrm{t})}{\sin \mathrm{t}}\left(\cos ^{\mathrm{n}-\mathrm{k}} \mathrm{t} \cos (\mathrm{n}-\mathrm{k}+1) \mathrm{t}\right) \mathrm{dt}\right] \\
&=\int_{0}^{\pi / 2} \psi_{\mathrm{x}}(\mathrm{t}) \frac{\mathrm{q}^{\mathrm{n}-\mathrm{k}-\mathrm{r}} 2^{\mathrm{n}-\mathrm{k}}}{\pi \mathrm{R}_{\mathrm{n}}(1+\mathrm{q})^{\mathrm{n}-\mathrm{k}}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{k}} \mathrm{q}_{\mathrm{n}-\mathrm{k}}\left(\frac{\cos ^{\mathrm{n}-\mathrm{k}} \mathrm{t} \cos (\mathrm{n}-\mathrm{k}+1) \mathrm{t}}{\sin \mathrm{t}}\right) \mathrm{dt} \\
&=\int_{0}^{\pi / 2} \psi_{\mathrm{x}}(\mathrm{t}) \frac{\mathrm{q}^{\mathrm{n}-\mathrm{k}-\mathrm{r}} 2^{\mathrm{n}-\mathrm{k}}}{\left(1+\tilde{\mathrm{N}}_{\mathrm{n}}(\mathrm{t}) \mathrm{dt}\right.} \\
&=\frac{\mathrm{q}^{\mathrm{n}-\mathrm{k}-\mathrm{r}} 2^{\mathrm{n}-\mathrm{k}}}{(1+\mathrm{q})^{\mathrm{n}-\mathrm{k}}}\left[\int_{0}^{1 / \mathrm{n}} \psi_{\mathrm{x}}(\mathrm{t}) \tilde{\mathrm{N}}_{\mathrm{n}}(\mathrm{t}) \mathrm{dt}+\int_{1 / \mathrm{n}}^{\pi / 2} \psi_{\mathrm{n}}(\mathrm{t}) \tilde{\mathrm{N}}_{\mathrm{n}}(\mathrm{t}) \mathrm{dt}\right] \\
&=\frac{q^{n-k-r} 2^{n-k}}{(1+q)^{n-k}}\left[I_{1}+I_{2}\right], \text { say } \tag{3}
\end{align*}
$$

For $0<\mathrm{t} \leq \frac{1}{\mathrm{n}}$

$$
\begin{align*}
\left|\mathrm{I}_{1}\right| & \leq \int_{0}^{1 / n}\left(\left|\Psi_{x}(\mathrm{t})\right|\left|\tilde{\mathrm{N}}_{\mathrm{n}}\right|\right) \mathrm{dt} \\
& \leq \int_{0}^{1 / \mathrm{n}}\left(\mathrm{Mt}^{\alpha}\left|\frac{1}{\pi \mathrm{R}_{\mathrm{n}}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{k}} \mathrm{q}_{\mathrm{n}-\mathrm{k}} \frac{\cos ^{\mathrm{n}-\mathrm{k}} \mathrm{t} \cos (\mathrm{n}-\mathrm{k}+1) \mathrm{t}}{\sin \mathrm{t}}\right|\right) \mathrm{dt} \\
& \leq \int_{0}^{1 / \mathrm{n}}\left(\mathrm{Mt}^{\alpha} \frac{1}{\pi \mathrm{R}_{\mathrm{n}}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{k}} \mathrm{q}_{\mathrm{n}-\mathrm{k}}\left(\frac{\left|\cos ^{\mathrm{n}-\mathrm{k}} \mathrm{t}\right| \cdot|\cos (\mathrm{n}-\mathrm{k}+1) \mathrm{t}|}{\sin \mathrm{t}}\right)\right) \mathrm{dt} \\
& =\left[\int_{0}^{1 / n} \mathrm{t}^{\alpha-1} \mathrm{dt}\right] \\
& =0\left(\frac{1}{\mathrm{n}^{\alpha}}\right) \tag{4}
\end{align*}
$$

$$
\text { for } \frac{1}{n}<t \leq \frac{\pi}{2} \text {, }
$$

$$
\left|I_{2}\right| \leq \int_{1 / \mathrm{n}}^{\pi / 2}\left(\left|\psi_{\mathrm{x}}(\mathrm{t})\right|\left|\tilde{N}_{\mathrm{n}}(\mathrm{t})\right|\right) \mathrm{dt}
$$

$$
=0\left[\int_{1 / n}^{\pi / 2}\left(t^{\alpha} \cdot \frac{R_{\tau}}{t R_{n}}\right)\right] d t
$$

$$
=0\left[\int_{1 / n}^{\pi / 2}\left(t^{\alpha-1} \frac{R_{\tau}}{R_{n}}\right)\right] d t
$$

$$
=0\left[\int_{2 / \pi}^{n} \frac{1}{4^{\alpha-1}} \frac{R(u)}{R_{n}} \frac{d u}{u^{2}}\right], \text { taking } t=\frac{1}{u}
$$

$$
=0\left[\int_{2 / \pi}^{n}\left(\frac{R_{(u)}}{R_{n}} \frac{d u}{u^{\alpha+1}}\right)\right]
$$

$$
=0\left[\frac{1}{n} \int_{2 / \pi}^{n} \frac{d u}{u^{\alpha}}\right],\left\{\frac{R_{(u)}}{u}\right\} \quad \text { is monotonic decreasing }
$$

$$
=\left\{\begin{array}{l}
0\left(\frac{1}{n^{\alpha}}\right) ; 0<\alpha<1  \tag{5}\\
0\left(\frac{\log n \pi}{n}\right) ; \alpha=1
\end{array}\right.
$$

Combining from (3) to (5), we have

$$
\begin{aligned}
& \left|\frac{1}{R_{n}} \sum_{k=0}^{n} p_{n-k} q_{k} \frac{1}{(1+q)^{k}} \sum_{r=0}^{k}\binom{k}{r} q^{k-r} \tilde{s}_{r}-\tilde{f}\right|=\left\{\begin{array}{l}
0\left(\frac{1}{\mathrm{n}^{\alpha}}\right) ; 0<\alpha<1 \\
0\left(\frac{\log \mathrm{n} \pi \mathrm{e}}{\mathrm{n}}\right) ; \alpha=1
\end{array}\right. \\
& \left\|\frac{1}{R_{n}} \sum_{k=0}^{n} p_{n-k} q_{k} \frac{1}{(1+q)^{k}} \sum_{r-0}^{k}\binom{k}{r} q^{k-r} \tilde{s}_{r}-\tilde{f}\right\|_{\infty} \\
& =\sup \left\{\left|\frac{1}{\mathrm{R}_{\mathrm{n}}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{n}-\mathrm{k}} \mathrm{q}_{\mathrm{k}} \frac{1}{(1+\mathrm{q})^{k}} \sum_{\mathrm{r}=0}^{\mathrm{k}}\binom{\mathrm{k}}{\mathrm{r}} \mathrm{q}^{\mathrm{k}-\mathrm{r}} \tilde{\mathrm{~s}}_{\mathrm{r}}(\mathrm{x})-\tilde{\mathrm{f}}(\mathrm{x})\right|: \mathrm{x} \in \mathrm{R}\right\}
\end{aligned}
$$

$$
=\left\{\begin{array}{l}
0\left(\frac{1}{n^{\alpha}}\right) ; 0<\alpha<1 \\
0\left(\frac{\log n \pi e}{n}\right) ; \alpha=1
\end{array}\right.
$$

## 5. APPLICATIONS

The following corollaries can be obtained from our theorem
Cor.1: Taking $\mathrm{q}_{\mathrm{n}}=1 \forall \mathrm{n} \geq 0$, the degree of approximation of $\tilde{f}(\mathrm{x})$, conjugate of a function $\mathrm{f} \in \mathrm{L}^{\mathrm{a}}$ ip $\alpha, 0<\alpha<1$, by $\left(\mathrm{N}, \mathrm{p}_{\mathrm{n}}\right)(\mathrm{E}, 1)$ means of the conjugate series of Fourier series (1) is given by

$$
\left\|\frac{1}{\mathrm{R}_{\mathrm{n}}} \sum_{\mathrm{k}=0}^{\mathrm{n}} \mathrm{p}_{\mathrm{n}-\mathrm{k}} \mathrm{q}_{\mathrm{k}} \frac{1}{(1+\mathrm{q})^{\mathrm{k}}} \sum_{\mathrm{r}=0}^{\mathrm{k}}\binom{\mathrm{k}}{\mathrm{r}} \mathrm{q}^{\mathrm{k}-\mathrm{r}} \tilde{\mathrm{~s}}_{\mathrm{r}}-\tilde{\mathrm{f}}\right\|_{\infty}=\mathrm{O}\left(\frac{1}{\mathrm{n}^{\alpha}}\right)
$$

Cor. 2: Taking $p_{n}=q_{n}=1 \forall n \geq 1$, the degree of approximation of $\tilde{f}(x)$, conjugate of a function $f \in L^{a}$ ip $\alpha, 0<\alpha<$ 1, by $(C, 1)(E, 1)$ means of the conjugate series of Fourier series (1) is given by

$$
\left\|\tilde{t}_{n}^{C E}-\tilde{f}\right\|_{\infty}=O\left(\frac{\log (n \pi e)}{n^{\alpha}}\right)
$$
