### ABSTRACT

We introduce a new class of sets namely  $^{**}\alpha$ -closed sets in topological spaces and derive the properties of  $^{**}\alpha$ -closed sets. Also we find the relationship between  $^{**}\alpha$ -closed sets and other existing sets. Moreover with the help of these sets, we introduce four new spaces namely,  ${}_aT_{1/2}^{***}$  spaces,  $T_c^{***}$  spaces,  ${}_aT_c^{***}$  spaces,  ${}_aT_{1/2}^{**}$  spaces and derived its properties.

**Key words:**  $^{**}\alpha$ -closed sets,  ${}_aT_{1/2}^{***}$  spaces,  $T_c^{***}$  spaces,  ${}_aT_c^{***}$  spaces,  ${}_aT_{1/2}^{**}$  spaces.

### 1. INTRODUCTION

Levine [15] introduced g-closed sets and studied their most fundamental properties. P.Bhattacharya and B.K.Lahiri [6], S.P.Arya and T.Nour [4], H.Maki *et al* [17, 18] introduced semi generalized-closed sets, generalized semi-closed,  $\alpha$ -generalized closed sets and generalized  $\alpha$ -closed sets respectively. R. Devi, *et al.* [10] introduced semi generalized-homeomorphism and generalized semi-homeomorphism in topological spaces. R. Devi, *et al* [9] introduced semi generalized-closed maps and generalized semi-closed maps. M.K.R.S Veera Kumar [23] introduced  $g^*$ -closed sets and M.Vigneshwaran, *et al* [24] introduced  $^*\alpha$ -closed sets in topological spaces and Gnanambal [14] introduced gsp- closed sets and gpr closed sets respectively.

In this paper, we introduce a new class of sets namely  $^{**}\alpha$ -closed sets in topological spaces and derive the properties. Also we find the relationship between  $^{**}\alpha$ -closed sets and the other existing sets. Moreover with the help of these sets, we introduce four new spaces,  ${}_aT_{1/2}^{***}$  spaces,  $T_c^{***}$  spaces,  ${}_aT_c^{***}$  spaces,  ${}_aT_{1/2}^{**}$  spaces and derive its properties.

### 2. PRELIMINARIES

Throughout this paper  $(X, \tau)$ , represent topological space on we no separation axioms are assumed unless otherwise to be mentioned. For a subsets A of  $(X, \tau)$ ,  $cl(A)$  and  $int(A)$  denote the closure and the interior of A in  $(X, \tau)$  respectively. The power set of X is denoted by  $P(X)$ .

Let us recall the following definitions, which are useful in the sequel.

**Definition 2.1:** A subset A of a topological space  $(X, \tau)$  is called

- (1) a pre-open set [20] if  $A \subseteq int(cl(A))$  and a pre-closed set if  $cl(int(A)) \subseteq A$ .
- (2) a semi-open set [16] if  $A \subseteq cl(int(A))$  and a semi-closed set if  $int(cl(A)) \subseteq A$ .
- (3) an  $\alpha$ -open set [22] if  $A \subseteq int(cl(int(A)))$  and an  $\alpha$ -closed set [22] if  $cl(int(cl(A))) \subseteq A$ .
- (4) a semi pre-open set [2] ( $= \beta$ -open[1]) if  $A \subseteq cl(int(cl(A)))$  and a semipre-closed set [2] ( $= \beta$ -closed[1]) if  $int(cl(int(A))) \subseteq A$ .

**Definition 2.2:** A subset A of a topological space (X,  $\tau$ ) is called

- (1) a generalized closed set (briefly g-closed) [15] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in (X,  $\tau$ ).
- (2) a semi-generalized closed set (briefly sg-closed) [6] if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and U is semi-open in (X,  $\tau$ ).
- (3) a generalized semi-closed set (briefly gs-closed) [4] if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in (X,  $\tau$ ).
- (4) a generalized  $\alpha$ -closed set (briefly g $\alpha$ -closed) [18] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is  $\alpha$ -open in (X,  $\tau$ ).
- (5) an  $\alpha$ -generalized closed set (briefly  $\alpha$ g-closed) [17] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in (X,  $\tau$ ).
- (6) a generalized semi pre-closed set (briefly gsp-closed) [12] if  $spcl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in (X,  $\tau$ ).
- (7) a generalized pre-closed set (briefly gp-closed) [19] if  $pcl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in (X,  $\tau$ ).
- (8) a  $g^*$ -closed set [23] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is open in (X,  $\tau$ ).
- (9) a  $^*g\alpha$ -closed set [24] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is  $g\alpha$ -open in (X,  $\tau$ ).

The class of all g-closed sets (gsp-closed sets) of a space (X,  $\tau$ ) is denoted by GC(X,  $\tau$ )(GSPC(X,  $\tau$ )).

**Definition 2.3:** A topological space (X,  $\tau$ ) is said to be

- (1) a  $T_b$  space [9] if every gs-closed set is closed.
- (2) an  ${}_aT_b$  space [8] if every  $\alpha$ g-closed set is closed.
- (3) a  $T_{1/2}^*$  space [23] if every  $g^*$ -closed set is closed.
- (4) a  $T_c$  space [23] if every gs-closed set is  $g^*$ -closed.
- (5) an  ${}_aT_c$  space [23] if every  $\alpha$ g-closed set is  $g^*$ -closed.
- (6) an  ${}_aT_{1/2}^{**}$  space [24] if every  $^*g\alpha$ -closed set is closed.
- (7) a  $T_c^{**}$  space [24] if every gs-closed set is  $^*g\alpha$ -closed.
- (8) an  ${}_aT_c^{**}$  space [24] if every  $\alpha$ g-closed set is  $^*g\alpha$ -closed.

**Notation 2.5:** For a space (X,  $\tau$ ), C(X,  $\tau$ ) (resp. SC(X,  $\tau$ ),  ${}_aC(X, \tau)$ ,  $G\alpha C(X, \tau)$ , GC(X,  $\tau$ ), GSC(X,  $\tau$ ),  $\alpha GC(X, \tau)$ ) denote the class of all closed (resp. semi-closed,  $\alpha$ -closed,  $g\alpha$ -closed, g-closed, gs-closed,  $\alpha$ g-closed) subsets of (X,  $\tau$ ).

### 3. BASIC PROPERTIES OF <sup>\*\*</sup>g $\alpha$ -CLOSED SETS

We introduce the following definition.

**Definition 3.1:** A subset A of (X,  $\tau$ ) is called a <sup>\*\*</sup>g $\alpha$ -closed set if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and U is  $^*g\alpha$ -open in (X,  $\tau$ ). The class of <sup>\*\*</sup>g $\alpha$ -closed subset of (X,  $\tau$ ) is denoted by <sup>\*\*</sup>G $\alpha$ C(X,  $\tau$ ).

**Theorem 3.2:** Every closed set is a <sup>\*\*</sup>g $\alpha$ -closed set.

**Proof:** Let  $A \subseteq U$  and U is  $^*g\alpha$ -open set in X. Since A is closed,  $cl(A) = A$ . Then  $cl(A) = A \subseteq U$  implies  $cl(A) \subseteq U$ . Hence A is <sup>\*\*</sup>g $\alpha$ -closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.3:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed sets =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ . Here  $\{a, c\}$  is a <sup>\*\*</sup>g $\alpha$ -closed set but not a closed set of (X,  $\tau$ ).

**Theorem 3.4** Every  $g^*$ -closed set is a <sup>\*\*</sup>g $\alpha$ -closed set.

**Proof:** Let  $A \subseteq U$  and U is  $^*g\alpha$ -open. Since every  $^*g\alpha$ -open set is g-open. Hence U is g-open. Since A is  $g^*$ -closed,  $cl(A) \subseteq U$ . Hence A is <sup>\*\*</sup>g $\alpha$ -closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.5:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}$ ;  $\tau^c = \{X, \phi, \{a, b\}\}$ ,  $g^*$ -closed sets =  $\{X, \phi, \{a, b\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed sets =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ . Here  $\{b, c\}$  is a <sup>\*\*</sup>g $\alpha$ -closed set but not a  $g^*$ -closed set of (X,  $\tau$ ).

**Theorem 3.6:** Every  $^*g\alpha$ -closed set is a <sup>\*\*</sup>g $\alpha$ -closed set.

**Proof:** Let  $A \subseteq U$  and U is a  $^*g\alpha$ -open set in X. Since every  $^*g\alpha$ -open set is  $g\alpha$ -open then U is  $g\alpha$ -open set. Since A is  $^*g\alpha$ -closed,  $cl(A) \subseteq U$ . Hence A is a <sup>\*\*</sup>g $\alpha$ -closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.7:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}$ ;  $\tau^c = \{X, \phi, \{a, b\}\}$ , <sup>\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a, b\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a, b\}, \{b, c\}, \{a, c\}\}$ .  
Here  $\{b, c\}$  is a <sup>\*</sup>g $\alpha$ -closed set but not a <sup>\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.8:** Every <sup>\*\*</sup>g $\alpha$ -closed set is g-closed set.

**Proof:** Let  $A \subseteq U$  and  $U$  is open set in  $X$ . Since every open set is <sup>\*</sup>g $\alpha$ -open,  $U$  is <sup>\*</sup>g $\alpha$ -open. Since  $A$  is a <sup>\*\*</sup>g $\alpha$ -closed,  $\text{cl}(A) \subseteq U$ . Hence  $A$  is g-closed.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.9:** Let  $X = \{a, b, c\}$ , with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ , g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$ .

Here  $\{a, b\}$  is a g-closed set but not a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.10:** Every <sup>\*\*</sup>g $\alpha$ -closed set is a  $\alpha$ g-closed set.

**Proof:** Let  $A \subseteq U$  and  $U$  is open set. Since every open set is <sup>\*</sup>g $\alpha$ -open,  $U$  is <sup>\*</sup>g $\alpha$ -open. Since  $A$  is a <sup>\*\*</sup>g $\alpha$ -closed,  $\text{cl}(A) \subseteq U$ . we know that  $\text{acl}(A) \subseteq \text{cl}(A) \subseteq U$  implies  $\text{acl}(A) \subseteq U$ . Hence  $A$  is a  $\alpha$ g-closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.11:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ ,  $\alpha$ g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$ .

Here  $\{a, b\}$  is a  $\alpha$ g-closed set but not a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.12:** Every <sup>\*\*</sup>g $\alpha$ -closed set is a gs-closed set.

**Proof:** Let  $A \subseteq U$  and  $U$  is an open set in  $X$ . Since every open set is <sup>\*</sup>g $\alpha$ -open. Then  $U$  is <sup>\*</sup>g $\alpha$ -open. Since  $A$  is <sup>\*\*</sup>g $\alpha$ -closed set,  $\text{cl}(A) \subseteq U$ . We know that  $\text{Scl}(A) \subseteq \text{cl}(A) \subseteq U$  implies  $\text{Scl}(A) \subseteq U$ . Hence  $A$  is a gs-closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.13:** Let  $X = \{a, b, c\}$ , with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$ .

Here  $\{a, c\}$  is a gs-closed set but not a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.14:** Every <sup>\*\*</sup>g $\alpha$ -closed set is a gsp-closed set.

**Proof:** Let  $A \subseteq U$  and  $U$  is an open set in  $X$ . Since every open set is <sup>\*</sup>g $\alpha$ -open,  $U$  is <sup>\*</sup>g $\alpha$ -open. Since  $A$  is <sup>\*\*</sup>g $\alpha$ -closed,  $\text{cl}(A) \subseteq U$ . We know that  $\text{spcl}(A) \subseteq \text{cl}(A) \subseteq U$  implies  $\text{spcl}(A) \subseteq U$ . Hence  $A$  is a gsp-closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.15:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ ;  $\tau^c = \{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$ , gsp-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$ .

Here  $\{a\}$  is a gsp-closed set but not a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.16:** Every <sup>\*\*</sup>g $\alpha$ -closed set is a gpr-closed set.

**Proof:** Let  $A \subseteq U$  and  $U$  is an open set in  $X$ . Since every regular open set is <sup>\*</sup>g $\alpha$ -open,  $U$  is <sup>\*</sup>g $\alpha$ -open. Since  $A$  is <sup>\*\*</sup>g $\alpha$ -closed,  $\text{cl}(A) \subseteq U$ . We know that  $\text{Pcl}(A) \subseteq \text{cl}(A) \subseteq U$  implies  $\text{Pcl}(A) \subseteq U$ . Hence  $A$  is a gpr-closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.17:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}\}$ ;  $\tau^c = \{X, \phi, \{b, c\}\}$ , gpr-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$

Here  $\{a\}$  is a gpr-closed set but not a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ .

**Theorem 3.18:** Every <sup>\*\*</sup>ga-closed set is a gp-closed set.

**Proof:** Let  $A \subseteq U$  and  $U$  is an open set in  $X$ . Since every open set is <sup>\*</sup>ga-open,  $U$  is <sup>\*</sup>ga-open set. Since  $A$  is <sup>\*\*</sup>ga-closed,  $\text{cl}(A) \subseteq U$ . We know that  $\text{Pcl}(A) \subseteq \text{cl}(A) \subseteq U$  implies  $\text{Pcl}(A) \subseteq U$ . Hence  $A$  is a gp-closed set.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 3.19:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ , gp-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ .

Here  $\{a\}$  is a gp-closed set but not a <sup>\*\*</sup>ga-closed set of  $(X, \tau)$ .

**Remark 3.20:** <sup>\*\*</sup>ga-closedness is independent of  $\alpha$ -closedness and semi-closedness, it can be seen from the following examples

**Examples 3.21:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{a, c\}, \{c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ ,  $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , semi-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ .

Let  $A = \{b, c\}$  is a <sup>\*\*</sup>ga-closed sets, but not a  $\alpha$ -closed set and semi-closed set in  $(X, \tau)$ .

**Examples 3.22:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ ,  $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , semi-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ .

Here  $\{a\}$  is a  $\alpha$ -closed set and semi-closed set, but not a <sup>\*\*</sup>ga-closed set in  $(X, \tau)$ .

**Remark 3.23:** <sup>\*\*</sup>ga-closedness is independent of pre-closedness and semi-pre closedness, it can be seen from the following examples

**Examples 3.24:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ , Pre-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , Semi-pre closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$

Here  $\{b, c\}$  is a <sup>\*\*</sup>ga-closed sets, but not a pre-closed set and semi-pre closed set in  $(X, \tau)$ .

**Examples 3.25:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ , pre-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , semi-pre closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$

Let  $B = \{a\}$  is a pre-closed set and semi-pre closed set, but not a <sup>\*\*</sup>ga-closed set in  $(X, \tau)$ .

**Remark 3.26:** <sup>\*\*</sup>ga-closedness is independent of sg-closedness and ga-closedness, it can be seen from the following examples

**Example 3.27:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ , sg-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , ga-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$

Let  $A = \{b, c\}$  is a <sup>\*\*</sup>ga-closed set, but not a sg-closed set and ga-closed set in  $(X, \tau)$ .

**Examples 3.28:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ , sg-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , ga-closed set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$

Here  $\{a\}$  is a sg-closed set and ga-closed set, but not a <sup>\*\*</sup>ga-closed set in  $(X, \tau)$ .

**Theorem 3.29:** If  $A$  and  $B$  are <sup>\*\*</sup>ga-closed sets. Then  $A \cup B$  is also a <sup>\*\*</sup>ga-closed set.

**Proof:** Let  $A$  and  $B$  are <sup>\*\*</sup>ga-closed sets. Let  $A \cup B \subseteq U$ ,  $U$  is <sup>\*</sup>ga-open. Since  $A$  and  $B$  are <sup>\*\*</sup>ga-closed sets,  $\text{cl}(A) \subseteq U$  and  $\text{cl}(B) \subseteq U$ . This implies that  $\text{cl}(A \cup B) = \text{cl}(A) \cup \text{cl}(B) \subseteq U$  implies  $\text{cl}(A \cup B) \subseteq U$ . Therefore  $A \cup B$  is <sup>\*\*</sup>ga-closed set.

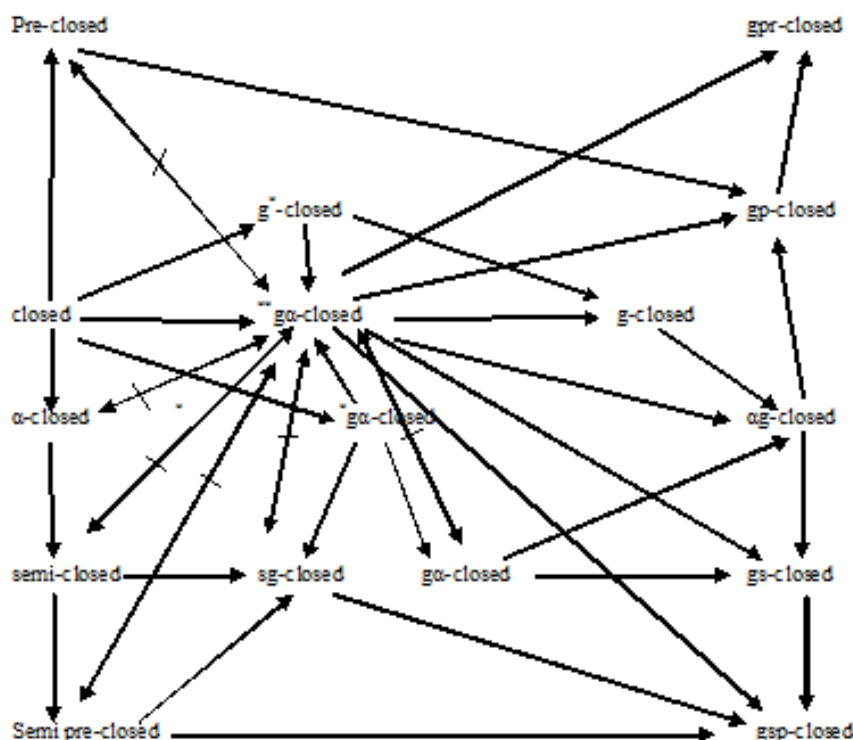

**Remark 3.30:** The intersection of two <sup>\*\*</sup>ga-closed set is again <sup>\*\*</sup>ga-closed set.

**Theorem 3.31:** Let  $X$  be a topological space. A subset  $A$  of  $(X, \tau)$  is <sup>\*\*</sup>ga-open if and only if  $U \subseteq (\text{Int}(A))$ , Whenever  $U$  is <sup>\*</sup>ga-closed set and  $U \subseteq A$ .

**Proof:** Let A be a <sup>\*\*</sup>g $\alpha$ -open set and U is <sup>\*</sup>g $\alpha$ -closed set such that  $U \subseteq A$  implies  $X-A \subseteq X-U$  and  $X-A$  is a <sup>\*\*</sup>g $\alpha$ -closed set. So  $\text{cl}(X-A) \subseteq X-U$  implies  $(X-(X-U)) \subseteq (X-\text{cl}(X-A)) = U$ . But  $(X-\text{cl}(X-A)) = \text{Int}(A)$ . Thus  $U \subseteq \text{Int}(A)$ . Conversely, suppose A is subset such that  $U \subseteq \text{Int}(A)$ . Whenever U is <sup>\*</sup>g $\alpha$ -closed and  $U \subseteq A$ . We show that  $X-A$  is <sup>\*\*</sup>g $\alpha$ -closed set. Let  $X-A \subseteq U$ , Where U is <sup>\*</sup>g $\alpha$ -open. Since  $X-A \subseteq U$  implies  $X-U \subseteq A$ . By assumption that we must have  $X-U \subseteq \text{Int}(A)$  or  $X-\text{Int}(A) \subseteq U$ . Now  $X-\text{Int}(A) = \text{cl}(X-A)$  which implies that  $\text{cl}(X-A) \subseteq U$  and  $X-A$  is <sup>\*\*</sup>g $\alpha$ -closed set.

**Remark 3.32:** The following diagram shows that relationships between <sup>\*\*</sup>g $\alpha$ -closed sets and some other sets in theorem 3.2, 3.4, 3.6, 3.8, 3.10, 3.12, 3.14, 3.16, 3.18 and remark 3.20, 3.23, 3.26 and reference [23], [24].

$A \rightarrow B$  ( $A \leftrightarrow B$ ) represents A implies B but not conversely (A and B are independent each other).

#### 4. APPLICATIONS OF <sup>\*\*</sup>g $\alpha$ -CLOSED SETS

We introduce the following definition.

**Definition 4.1:** A space  $(X, \tau)$  is called a  ${}_aT_{1/2}^{***}$  space if every <sup>\*\*</sup>g $\alpha$ -closed set is closed.

**Theorem 4.2:** Every  $T_{1/2}$  space is an  ${}_aT_{1/2}^{***}$  space.

**Proof:** Let A be a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since every <sup>\*\*</sup>g $\alpha$ -closed set is g-closed, A is a g-closed. Since  $(X, \tau)$  is a  $T_{1/2}$  space, A is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space.

The converse of the above theorem need not be true. It can be seen from the following example.

**Example 4.3:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ , g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$ .

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space but not a  $T_{1/2}$  space. Since  $\{a, b\}$  is a g-closed set, but not a closed set of  $(X, \tau)$ .

**Theorem 4.4:** Every  $T_b$  space is an  ${}_aT_{1/2}^{***}$  space.

**Proof:** Let A be a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since every <sup>\*\*</sup>g $\alpha$ -closed set is gs-closed, A is a gs-closed. Since  $(X, \tau)$  is a  $T_b$  space, A is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space.

The space in the following example is an  ${}_aT_{1/2}^{***}$  space, but not a  $T_b$  space.

**Example 4.5:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}; \tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ , g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space but not a  $T_b$  space. Since  $\{a, b\}$  is a g $\alpha$ -closed set but not a closed set.

**Theorem 4.6:** Every  ${}_aT_b$  space is  ${}_aT_{1/2}^{***}$  space.

**Proof:** Let  $A$  be a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since every <sup>\*\*</sup>g $\alpha$ -closed set is  $\alpha$ g-closed,  $A$  is a  $\alpha$ g-closed. Since  $(X, \tau)$  is a  ${}_aT_b$  space,  $A$  is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space.

The space in the following example is an  ${}_aT_{1/2}^{***}$  space, but not an  ${}_aT_b$  space.

**Example 4.7:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}; \tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ ,  $\alpha$ g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space but not an  ${}_aT_b$  space. Since  $\{a, b\}$  is an  $\alpha$ g-closed set but not a closed set.

The following theorem gives a characterization of  ${}_aT_{1/2}^{***}$  space.

**Theorem 4.8:** If  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space, then every singleton of  $X$  is either <sup>\*</sup>g $\alpha$ -closed or open.

**Proof:** Let  $x \in X$  and suppose that  $\{x\}$  is not a <sup>\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Then  $X/\{x\}$  is not a <sup>\*</sup>g $\alpha$ -open. This implies that  $X$  is the only <sup>\*</sup>g $\alpha$ -open set containing  $X/\{x\}$ . So  $X/\{x\}$  is a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space,  $X/\{x\}$  is closed (or) equivalently  $\{x\}$  is open in  $(X, \tau)$ .

**Theorem 4.9:** Every  ${}_aT_{1/2}^{***}$  space is  ${}_aT_{1/2}^{**}$  space.

**Proof:** Let  $A$  be <sup>\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since every <sup>\*</sup>g $\alpha$ -closed set is <sup>\*\*</sup>g $\alpha$ -closed set. Since  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space,  $A$  is closed. Therefore  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Examl 4.10:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}; \tau^c = \{X, \phi, \{a, b\}\}$   
<sup>\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a, b\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{**}$  space. Let  $A = \{a, c\}$  be a <sup>\*\*</sup>g $\alpha$ -closed set but not closed set. Therefore  $(X, \tau)$  is not an  ${}_aT_{1/2}^{***}$  space.

**Theorem 4.11:** Every  ${}_aT_{1/2}^{***}$  space is a  $T_{1/2}^*$  space.

**Proof:** Let  $A$  be  $g^*$ -closed set of  $(X, \tau)$ . Since every  $g^*$ -closed set is <sup>\*\*</sup>g $\alpha$ -closed set. Since  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space,  $A$  is closed. Therefore  $(X, \tau)$  is a  $T_{1/2}^*$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.12:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}; \tau^c = \{X, \phi, \{a, b\}\}$ ,  $g^*$ -closed set =  $\{X, \phi, \{a, b\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ .

Here  $(X, \tau)$  is a  $T_{1/2}^*$  space. Let  $A = \{a, c\}$  be a <sup>\*\*</sup>g $\alpha$ -closed set, but not closed set. Therefore  $(X, \tau)$  is not an  ${}_aT_{1/2}^{***}$  space.

**Definition 4.13:** A space of  $(X, \tau)$  is called a  $T_c^{***}$  space if every g $\alpha$ -closed set is <sup>\*\*</sup>g $\alpha$ -closed.

The following Theorem gives a characterization of  $T_c^{***}$  spaces.

**Theorem 4.14:** If  $(X, \tau)$  is a  $T_c^{***}$  space, then every singleton of  $X$  is either closed or <sup>\*\*</sup>g $\alpha$ -open.

**Proof:** Let  $x \in X$  and suppose that  $\{x\}$  is not a closed set of  $(X, \tau)$ . Then  $X/\{x\}$  is not an open. This implies  $x$  is the only open set containing  $X/\{x\}$ . So,  $X/\{x\}$  is g $\alpha$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is  $T_c^{***}$  space,  $X/\{x\}$  is a <sup>\*\*</sup>g $\alpha$ -closed set or equivalently  $\{x\}$  is <sup>\*\*</sup>g $\alpha$ -open in  $(X, \tau)$ .

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.15:** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, X, \{a\}, \{c\}, \{a, c\}\}; \tau^c = \{X, \phi, \{b, c\}, \{a, b\}, \{b\}\}$  <sup>\*\*</sup>ga-open set =  $\{X, \phi, \{a\}, \{c\}, \{a, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{a, b\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$ . Here  $\{a\}$  and  $\{c\}$  are <sup>\*\*</sup>ga-open sets and  $\{b\}$  is a closed set but  $(X, \tau)$  is not a  $T_c^{***}$  space. Since  $\{a\}$  is a gs-closed but not a <sup>\*\*</sup>ga-closed set of  $(X, \tau)$ .

**Theorem 4.16:** Every  $T_b$  space is a  $T_c^{***}$  space.

**Proof:** Let  $A$  be a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_b$  space,  $A$  is closed. Since every closed set is <sup>\*\*</sup>ga-closed,  $A$  is <sup>\*\*</sup>ga-closed set. Therefore  $(X, \tau)$  is a  $T_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.17:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}; \tau^c = \{X, \phi, \{c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$

Here  $\{b, c\}$  is a <sup>\*\*</sup>ga-closed set of  $(X, \tau)$ , but it is not a closed set of  $(X, \tau)$ .

**Theorem 4.18:** Every  $T_c^{***}$  space is a  $T_d$  space.

**Proof:** Let  $A$  be gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{***}$  space,  $A$  is <sup>\*\*</sup>ga-closed set. Since every <sup>\*\*</sup>ga-closed set is g-closed,  $A$  is g-closed set. Therefore  $(X, \tau)$  is a  $T_d$ -space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.19:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}; \tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$

Here  $\{b\}$  is a gs-closed set, but not <sup>\*\*</sup>ga-closed set.

**Theorem 4.20:** Every  $T_c^{***}$  space is a  $T_d$  space.

**Proof:** Let  $A$  be an  $\alpha$ g-closed set of  $(X, \tau)$ . Since every  $\alpha$ g-closed set is gs-closed,  $A$  is gs-closed. Since  $(X, \tau)$  is a  $T_c^{***}$  space,  $A$  is <sup>\*\*</sup>ga-closed. Since every <sup>\*\*</sup>ga-closed set g-closed,  $A$  is g-closed set. Therefore  $(X, \tau)$  is an  $T_d$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.21:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}; \tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ ,  $\alpha$ g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$ . Here  $\{a, b\}$  is an  $\alpha$ g-closed set, but not a <sup>\*\*</sup>ga-closed set.

**Theorem 4.22:** The space  $(X, \tau)$  is a  $T_b$  space if and only if it is a  $T_c^{***}$  space and  $T_{1/2}^{***}$ .

**Proof: Necessity part:** Let  $A$  be a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_b$  space,  $A$  is closed. Since every closed set is <sup>\*\*</sup>ga-closed,  $A$  is <sup>\*\*</sup>ga-closed set. Therefore  $(X, \tau)$  is a  $T_c^{***}$  space. Let  $A$  be a <sup>\*\*</sup>ga-closed set of  $(X, \tau)$ . Since every <sup>\*\*</sup>ga-closed set is gs-closed,  $A$  is a gs-closed. Since  $(X, \tau)$  is a  $T_b$  space,  $A$  is closed. Therefore  $(X, \tau)$  is an  $T_{1/2}^{***}$  space.

**Sufficient part:** Let  $A$  be a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{***}$  space,  $A$  is <sup>\*\*</sup>ga-closed set. Since  $(X, \tau)$  is an  $T_{1/2}^{***}$  space,  $A$  is closed. Therefore  $(X, \tau)$  is a  $T_b$  space.

**Theorem 4.23:** Every  $T_c$ -space is a  $T_c^{***}$  space.

**Proof:** Let  $A$  be a gs-closed set. Since  $(X, \tau)$  is a  $T_c$  space,  $A$  is a  $g^*$ -closed set. Since every  $g^*$ -closed set is <sup>\*\*</sup>ga-closed set,  $A$  is <sup>\*\*</sup>ga-closed. Therefore  $(X, \tau)$  is a  $T_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.24:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}; \tau^c = \{X, \phi, \{a, b\}\}$ ,  $g^*$ -closed set =  $\{X, \phi, \{a, b\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ .

Here  $(X, \tau)$  is a  $T_c^{***}$  space. Let  $A = \{a, c\}$  be a gs-closed set but not a  $g^*$ -closed set. Therefore  $(X, \tau)$  is not a  $T_c$  space.

**Theorem 4.25:** Every  $T_c^{**}$  space is a  $T_c^{***}$  space.

**Proof:** Let A be a gs-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is a  $T_c^{***}$  space, A is <sup>\*</sup>ga-closed. Since every <sup>\*</sup>ga-closed set is <sup>\*\*</sup>ga-closed. Therefore  $(X, \tau)$  is a  $T_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.26:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}$ ;  $\tau^c = \{X, \phi, \{a, b\}\}$ , <sup>\*</sup>ga-closed set =  $\{X, \phi, \{a, b\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$

Here  $(X, \tau)$  is a  $T_c^{***}$  space. Let  $A = \{a, c\}$  be a gs-closed set but not a <sup>\*</sup>ga-closed set. Therefore  $(X, \tau)$  is not a  $T_c^{**}$  space.

**Remark 4.27:**  $T_c^{***}$  space and  ${}_aT_{1/2}^{***}$  space are independent of each other. It can be seen by the following examples.

**Example 4.28:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{b, c\}, \{a\}\}$ , ag-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}\}$ .

Here  $(X, \tau)$  is an  ${}_aT_{1/2}^{***}$  space but not  $T_c^{***}$  space. Since  $\{b\}$  is a gs-closed set but not closed set.

**Example 4.29:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$

Here  $(X, \tau)$  is a  $T_c^{***}$  space but not an  ${}_aT_{1/2}^{***}$  space. Since  $\{b, c\}$  is a <sup>\*\*</sup>ga-closed set but not closed set.

**Definition 4.30:** A space  $(X, \tau)$  is called an  ${}_aT_c^{***}$  space if every ag-closed set is <sup>\*\*</sup>ga-closed.

**Theorem 4.31:** Every  ${}_aT_c^{***}$  space is a  ${}_aT_d$  space.

**Proof:** Let A be a ag-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  ${}_aT_c^{***}$  space, A is <sup>\*\*</sup>ga-closed. Since every <sup>\*\*</sup>ga-closed set is g-closed, A is g-closed set. Therefore  $(X, \tau)$  is an  ${}_aT_d$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.32:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ , ag-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$ , g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ .

Here  $(X, \tau)$  is a  ${}_aT_d$  space but not an  ${}_aT_c^{***}$  space. Since  $\{c\}$  is an ag-closed set but not <sup>\*\*</sup>ga-closed set.

**Theorem 4.33:** Every  $T_c^{***}$  space is an  ${}_aT_c^{***}$  space.

**Proof:** Let A be a ag-closed set of  $(X, \tau)$ . Since every ag-closed set is gs-closed, A is gs-closed. Since  $(X, \tau)$  is a  $T_c^{***}$  space, A is <sup>\*\*</sup>ga-closed set. Therefore  $(X, \tau)$  is an  ${}_aT_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.34:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}, \{a, c\}, \{b, c\}\}$ , ag-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{a, c\}, \{b, c\}\}$ . Here  $(X, \tau)$  is a  ${}_aT_c^{***}$  space but not a  $T_c^{***}$  space. Since  $\{a, b\}$  is a gs-closed set but not <sup>\*\*</sup>ga-closed set.

**Theorem 4.35:** Every  $T_b$  space is an  ${}_aT_c^{***}$  space.

**Proof:** Let A be a ag-closed set of  $(X, \tau)$ . Since every ag-closed set is gs-closed, A is gs-closed. Since  $(X, \tau)$  is a  $T_b$  space, A is closed set. Since every closed set is <sup>\*\*</sup>ga-closed, A is a <sup>\*\*</sup>ga-closed set. Therefore  $(X, \tau)$  is an  ${}_aT_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.36:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ , ag-closed set =  $\{X, \phi, \{c\}, \{a, c\}, \{b, c\}\}$ , gs-closed set =  $\{X, \phi, \{c\}, \{a, c\}, \{b, c\}\}$ , <sup>\*\*</sup>ga-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$

Here  $(X, \tau)$  is an  ${}_aT_c^{***}$  space but not a  $T_b$  space. Since  $\{a, c\}$  is a gs-closed set but not closed set.

**Theorem 4.37:** Every  ${}_aT_b$  space is an  ${}_aT_c^{***}$  space.

**Proof:** Let A be a  $\alpha$ g-closed set of  $(X, \tau)$  since  $(X, \tau)$  is an  $\alpha T_b$  space, A is closed. Since every closed set is <sup>\*\*</sup>g $\alpha$ -closed, A is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an  $\alpha T_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.38:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ ,  $\alpha$ g-closed set =  $\{X, \phi, \{b, c\}, \{a, c\}, \{c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{c\}, \{a, c\}, \{b, c\}\}$

Here  $(X, \tau)$  is an  $\alpha T_c^{***}$  space but not an  $\alpha T_b$  space. Since  $\{b, c\}$  is an  $\alpha$ g-closed set but not closed set.

**Theorem 4.39:** Every  $\alpha T_c$  space is an  $\alpha T_c^{***}$  space.

**Proof:** Let A be a  $\alpha$ g-closed set. Since  $(X, \tau)$  is a  $\alpha T_c$  space, A is a  $g^*$ -closed set. Since every  $g^*$ -closed set is <sup>\*\*</sup>g $\alpha$ -closed set, A is <sup>\*\*</sup>g $\alpha$ -closed. Therefore  $(X, \tau)$  is a  $\alpha T_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.40:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}$ ;  $\tau^c = \{X, \phi, \{a, b\}\}$ ,  $g^*$ -closed set =  $\{X, \phi, \{a, b\}\}$   
 $\alpha$ g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$

Here  $(X, \tau)$  is a  $\alpha T_c^{***}$  space but not a  $\alpha T_c$  space. Let  $A = \{a, c\}$  is an  $\alpha$ g-closed set but not a  $g^*$ -closed set. Therefore  $(X, \tau)$  is not a  $\alpha T_c$  space.

**Theorem 4.41:** Every  $\alpha T_c^{**}$  space is an  $\alpha T_c^{***}$  space.

**Proof:** Let A be a  $\alpha$ g-closed set. Since  $(X, \tau)$  is an  $\alpha T_c^{**}$  space, A is a <sup>\*</sup>g $\alpha$ -closed set. Since every <sup>\*</sup>g $\alpha$ -closed set is <sup>\*\*</sup>g $\alpha$ -closed set, A is <sup>\*\*</sup>g $\alpha$ -closed. Therefore  $(X, \tau)$  is a  $\alpha T_c^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.42:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{c\}\}$ ;  $\tau^c = \{X, \phi, \{a, b\}\}$ , <sup>\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a, b\}\}$ ,  
 $\alpha$ g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, c\}\}$   
 Here  $(X, \tau)$  is a  $\alpha T_c^{***}$  space. Let  $A = \{a, c\}$  is an  $\alpha$ g-closed set but not a <sup>\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is not a  $\alpha T_c^{**}$  space.

**Theorem 4.43:** A space  $(X, \tau)$  is an  $\alpha T_b$  space iff it is an  $\alpha T_c^{***}$  and an  $\alpha T_{1/2}^{***}$

**Proof: Necessity part:** Let A be a  $\alpha$ g-closed set of  $(X, \tau)$  since  $(X, \tau)$  is an  $\alpha T_b$  space, A is closed. Since every closed set is <sup>\*\*</sup>g $\alpha$ -closed, A is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an  $\alpha T_c^{***}$  space. Let A be a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since every <sup>\*\*</sup>g $\alpha$ -closed set is  $\alpha$ g-closed, A is a  $\alpha$ g-closed. Since  $(X, \tau)$  is an  $\alpha T_b$  space, A is closed. Therefore  $(X, \tau)$  is an  $\alpha T_{1/2}^{***}$  space.

**Sufficient part:** Let A be a  $\alpha$ g-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  $\alpha T_c^{***}$  space, A is <sup>\*\*</sup>g $\alpha$ -closed. Since  $(X, \tau)$  is an  $\alpha T_{1/2}^{***}$  space, A is closed set. Therefore  $(X, \tau)$  is an  $\alpha T_b$  space.

**Remark 4.44:**  $\alpha T_c^{***}$  space and  $T_{1/2}^{***}$  space are independent of each other. It can be seen from the following example.

**Example 4.45:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{c\}, \{a, c\}, \{b, c\}\}$

Here  $(X, \tau)$  is an  $\alpha T_c^{***}$  space but not an  $\alpha T_{1/2}^{***}$  space. Since  $\{a, c\}$  is a <sup>\*\*</sup>g $\alpha$ -closed set but not closed set.

**Example 4.46:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$ ,  $\alpha$ g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$  <sup>\*\*</sup>g $\alpha$ -closed =  $\{X, \phi, \{a\}, \{b, c\}\}$

Here  $(X, \tau)$  is a  $\alpha T_{1/2}^{***}$  space, but not an  $\alpha T_c^{***}$  space. Since  $\{b, c\}$  is an  $\alpha$ g-closed set but not <sup>\*\*</sup>g $\alpha$ -closed set.

**Definition 4.47:** A space  $(X, \tau)$  is called a  $\alpha T_{1/2}^{***}$  space if every  $g$ -closed set is <sup>\*\*</sup>g $\alpha$ -closed.

**Theorem 4.48:** Every  $T_{1/2}$  space is an  $\alpha T_{1/2}^{***}$  space.

**Proof:** Let A be a  $g$ -closed set of  $(X, \tau)$  since  $(X, \tau)$  is an  $T_{1/2}$  space, A is closed. Since every closed set is <sup>\*\*</sup>g $\alpha$ -closed, A is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an  $\alpha T_{1/2}^{***}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.49:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, b\}\}$ ;  $\tau^c = \{X, \phi, \{c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$ , g-closed set =  $\{X, \phi, \{c\}, \{b, c\}, \{a, c\}\}$

Here  $(X, \tau)$  is a <sup>\*\*\*</sup> $T_{1/2}$  space but not  $T_{1/2}$  space. Since  $\{b, c\}$  is a g-closed set but not closed set.

**Theorem 4.50:** Every  $T_b$  space is a <sup>\*\*\*</sup> $T_{1/2}$  space.

**Proof:** Let  $A$  be a g-closed set of  $(X, \tau)$ . Since every g-closed set is gs-closed,  $A$  is gs-closed. Since  $(X, \tau)$  is a  $T_b$  space,  $A$  is closed set. Since every closed set is <sup>\*\*</sup>g $\alpha$ -closed,  $A$  is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an  $T_c$  <sup>\*\*\*</sup> space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.51:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$  g-closed set =  $\{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$

Here  $(X, \tau)$  is a <sup>\*\*\*</sup> $T_{1/2}$  space but not a  $T_b$  space. Since  $\{a, b\}$  is a gs-closed set but not closed set.

**Theorem 4.52:** Every  $T_b$  space is a <sup>\*\*\*</sup> $T_{1/2}$  space.

**Proof:** Let  $A$  be a g-closed set of  $(X, \tau)$ . Since every g-closed set is  $\alpha$ g-closed,  $A$  is  $\alpha$ g-closed. Since  $(X, \tau)$  is an  $T_b$  space,  $A$  is closed set. Since every closed set is <sup>\*\*</sup>g $\alpha$ -closed,  $A$  is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an <sup>\*\*\*</sup> $T_{1/2}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.53:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, c\}\}$ ;  $\tau^c = \{X, \phi, \{b\}\}$ , g-closed set =  $\{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$  gs-closed set =  $\{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$ ,  $\alpha$ g-closed set =  $\{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$

Here  $(X, \tau)$  is a <sup>\*\*\*</sup> $T_{1/2}$  space but not an  $T_b$  space. Since  $\{b, c\}$  is an  $\alpha$ g-closed set but not closed set.

**Theorem 4.54:** Every  $T_c$  <sup>\*\*\*</sup> space is a <sup>\*\*\*</sup> $T_{1/2}$  space.

**Proof:** Let  $A$  be a g-closed set of  $(X, \tau)$ . Since every g-closed set is gs-closed,  $A$  is gs-closed set. Since  $(X, \tau)$  is a  $T_c$  <sup>\*\*\*</sup> space,  $A$  is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an <sup>\*\*\*</sup> $T_{1/2}$  space.

The converse of the above theorem is not true. It can be seen by the following example.

**Example 4.55:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{b\}, \{c\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$  g-closed set =  $\{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$ , gs-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{a, b\}\}$  <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{a, b\}, \{a, c\}\}$

Here  $(X, \tau)$  is a <sup>\*\*\*</sup> $T_{1/2}$  space but not an  $T_c$  <sup>\*\*\*</sup> space. Since  $\{b\}$  is a gs-closed set but not <sup>\*\*</sup>g $\alpha$ -closed set.

**Theorem 4.56:** The space  $(X, \tau)$  is a  $T_{1/2}$  space if and only if it is a <sup>\*\*\*</sup> $T_{1/2}$  space and an  $T_{1/2}$  <sup>\*\*\*</sup> space.

**Proof: Necessity part:** Let  $A$  be a g-closed set of  $(X, \tau)$  since  $(X, \tau)$  is an  $T_{1/2}$  space,  $A$  is closed. Since every closed set is <sup>\*\*</sup>g $\alpha$ -closed,  $A$  is <sup>\*\*</sup>g $\alpha$ -closed set. Therefore  $(X, \tau)$  is an <sup>\*\*\*</sup> $T_{1/2}$  space. Let  $A$  be a <sup>\*\*</sup>g $\alpha$ -closed set of  $(X, \tau)$ . Since every <sup>\*\*</sup>g $\alpha$ -closed set is g-closed,  $A$  is a g-closed. Since  $(X, \tau)$  is a  $T_{1/2}$  space,  $A$  is closed. Therefore  $(X, \tau)$  is an  $T_{1/2}$  <sup>\*\*\*</sup> space.

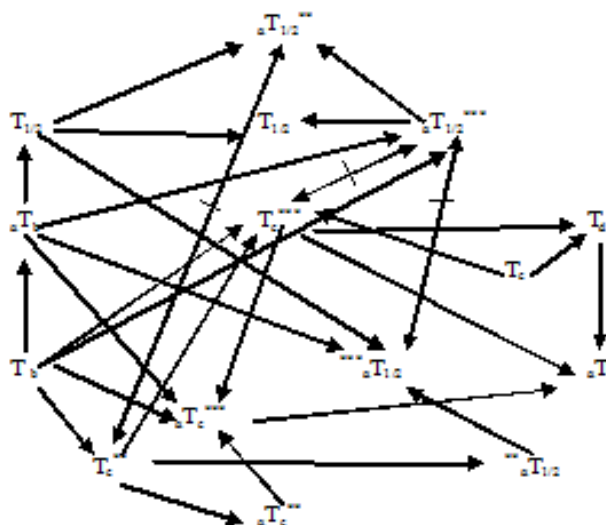

**Sufficient part:** Let  $A$  be a g-closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an <sup>\*\*\*</sup> $T_{1/2}$  space,  $A$  is <sup>\*\*</sup>g $\alpha$ -closed. Since  $(X, \tau)$  is an  $T_{1/2}$  <sup>\*\*\*</sup> space,  $A$  is closed set. Therefore  $(X, \tau)$  is a  $T_{1/2}$  space.

**Remark 4.57:** <sup>\*\*\*</sup> $T_{1/2}$  space and  $T_{1/2}$  <sup>\*\*\*</sup> space are independent of each other. It can be seen from the following example

**Example 4.58:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$ ;  $\tau^c = \{X, \phi, \{a\}, \{b, c\}\}$  g-closed set =  $\{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{a\}, \{b, c\}\}$  Here  $(X, \tau)$  is an  $T_{1/2}$  <sup>\*\*\*</sup> space but not an <sup>\*\*\*</sup> $T_{1/2}$  space. Since  $\{c\}$  is a g-closed set but not <sup>\*\*</sup>g $\alpha$ -closed set.

**Example 4.59:** Let  $X = \{a, b, c\}$  with  $\tau = \{X, \phi, \{a, c\}\}$ ;  $\tau^c = \{X, \phi, \{b\}\}$ , <sup>\*\*</sup>g $\alpha$ -closed set =  $\{X, \phi, \{b\}, \{a, b\}, \{b, c\}\}$  Here  $(X, \tau)$  is a <sup>\*\*\*</sup> $T_{1/2}$  space but not an  $T_{1/2}$  <sup>\*\*\*</sup> space. Since  $\{a, b\}$  is a <sup>\*\*</sup>g $\alpha$ -closed set but not closed set.

**Remark 4.60:** The following diagram shows them relationship among the separation axioms considered in this paper and reference [23], [24].  $A \rightarrow B$  ( $A \nrightarrow B$ ) represents A implies B but B need not imply A always. (A and B are independent of each other).
