#### Abstract

In this paper we introduce a new class of weaker form of continuous function called Contra b $\hat{g}$-continuous function. Some characterization and several properties concerning Contra bĝg-continuity are obtained.

Keywords: bĝg - Closed sets, bĝ-continuous, Contra bĝ-continuous, Contra bĝ-irresolute.
AMS subject classification: 54C08, 54C10.

## 1. INTRODUCTION

Levine [4] introduced generalized closed sets in topological spaces. Veerakumar [2] introduced $\hat{\mathrm{g}}$-closed sets in topological spaces. Andrijevic[1] introduced a new class of generalized open sets called b-open sets. R. Subasree and M.Maria Singam [3] introduced bĝ-closed sets in topological spaces.

Dontchev[6] introduced and investigated a new notion of continuity called Contra continuity. The purpose of this paper is to introduce and investigate some of the properties of contra bg -continuous functions, contra bg -irresolute functions and we obtain some of its characterization.

## 2. PRELIMINARIES

Throughout this paper ( $\mathrm{X}, \tau$ ) (or simply X ) represents topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset A of $\mathrm{X}, \operatorname{cl}(\mathrm{A}), \operatorname{Int}(\mathrm{A})$ and $\mathrm{A}^{\mathrm{c}}$ denote the closure of A , interior of A and the complement of A respectively. Let us recall the following definitions.

Definition 2.1: A subset A of a space ( $\mathrm{X}, \tau$ ) is called a
i) Semi-open set [6] if A $\subseteq \mathrm{cl}[\operatorname{Int}(\mathrm{A})]$
ii) $\alpha$-open set[9] if $\mathrm{A} \subseteq \operatorname{Int[cl(Int(A))]}$
iii) b-open set[7] if A $\subseteq c l[\operatorname{Int}(A)] U \operatorname{Int}[c l(A)]$

The complement of a semi-open (resp. $\alpha$-open, b-open) set is called semi-closed (resp. $\alpha$-closed, b-closed) set.
The intersection of all semi-closed (resp. $\alpha$-closed, b-closed) sets of X containing A is called the semi-closure (resp. $\alpha$-closure, b -closure) and is denoted by $\operatorname{scl}(\mathrm{A})($ resp. $\alpha \mathrm{cl}(\mathrm{A}), \mathrm{bcl}(\mathrm{A})$ ). The family of all semi-open (resp. $\alpha$-open, b -open) subsets of a space X is denoted by $\mathrm{SO}(\mathrm{X})($ resp. $\alpha \mathrm{O}(\mathrm{X}), \mathrm{bO}(\mathrm{X})$ ).

Definition 2.2: A subset A of a topological space ( $\mathrm{X}, \tau$ ) is called
i) generalized closed(briefly g-closed) set[4] if $\mathrm{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \sqsubseteq \mathrm{U}$ and U is open set in $(\mathrm{X}, \tau)$.
ii) $\hat{\mathrm{g}}$-closed set[2] if $\mathrm{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is a semi-open set in $(\mathrm{X}, \tau)$.
iii) bĝ -closed set[3] if $\operatorname{bcl}(\mathrm{A}) \sqsubseteq \mathrm{U}$ whenever $\mathrm{A} \sqsubset \mathrm{U}$ and U is $\hat{\mathrm{g}}$-open set in $(\mathrm{X}, \tau)$.
*Research Scholar, V.O. Chidambaram College, Tuticorin, (TN), India.

The complement of a g-closed (resp. $\hat{\mathrm{g}}$-closed and bg -closed) set is called g -open (resp. $\hat{\mathrm{g}}$-open and b $\hat{\mathrm{g}}$-open) set .
Definition 2.3: A space (X, $\tau$ ) is called a $\mathrm{Tb} \hat{\mathrm{g}}$ - space [3] if every bg - closed set in it is b-closed.
Definition 2.4: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is called
i) $b \hat{g}-$ continuous [5] map if $f^{-1}(\mathrm{~V})$ is b $\hat{g}-$ closed in $(\mathrm{X}, \tau)$ for every closed set V in $(\mathrm{Y}, \sigma)$.
ii) bĝ - irresolute [5] map if $f^{-1}(\mathrm{~V})$ is b $\hat{g}$-closed in $(\mathrm{X}, \tau)$ for every bĝ -closed set V in $(\mathrm{Y}, \sigma)$.

Definition 2.5: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is called
i) contra continuous $[10]$ map if $f^{-1}(\mathrm{~V})$ is closed in $(\mathrm{X}, \tau)$ for every open set V in $(\mathrm{Y}, \sigma)$.
ii) contra semi-continuous[6] map if $f^{-1}(\mathrm{~V})$ is semi-closed in $(\mathrm{X}, \tau)$ for every open set V in $(\mathrm{Y}, \sigma)$.
iii) contra $\alpha$-continuous[9] map if $f^{-1}(\mathrm{~V})$ is $\alpha$-closed in ( $\mathrm{X}, \tau$ ) for every open set V in $(\mathrm{Y}, \sigma)$.
iv) contra b-continuous[12] map if $f^{-1}(\mathrm{~V})$ is b-closed in $(\mathrm{X}, \tau)$ for every open set V in $(\mathrm{Y}, \sigma)$.
v) contra g-continuous[11] map if $f^{-1}(\mathrm{~V})$ is g-closed in ( $\mathrm{X}, \tau$ ) for every open set V in $(\mathrm{Y}, \sigma)$.

## 3. Contra bĝ - Continuous function

Definition 3.1: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is called contra b $\hat{\mathrm{g}}$-continuous if $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{\mathrm{g}}$-closed in $(\mathrm{X}, \tau)$ for every open set V in $(\mathrm{Y}, \sigma)$.

Example 3.2: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}, \mathrm{b}\},\{\mathrm{c}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{b}$.
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
Here the inverse images of open sets $\{a, b\}$ and $\{c\}$ in $Y$ are $\{a, c\}$ and $\{b\}$ respectively which are $b \hat{g}$ - closed sets in $X$. Hence f is contra bg - continuous.

Theorem 3.3: Every contra continuous function is contra b $\hat{g}$ - continuous.

Proof: Let V be any open set in $(\mathrm{Y}, \sigma)$. Since f is contra continuous, $f^{-1}(\mathrm{~V})$ is closed in $(\mathrm{X}, \tau)$. Since from [3] Remark 3.23 "Every closed set is b $\hat{g}-$ Closed". Then $f^{-1}(\mathrm{~V})$ is $b \hat{g}-$ Closed in $(\mathrm{X}, \tau)$. Hence f is contra $\mathrm{b} \hat{g}-$ continuous.

Remark 3.4: The converse of the above theorem need not be true.
(i.e) Every contra bg - continuous function need not be contra continuous as shown in the following example.

Example 3.5: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{a}, \mathrm{f}(\mathrm{d})=\mathrm{d}$.
$b \hat{g}-C(X)=\{X, \Phi,\{b\},\{c\},\{d\},\{b, c\},\{c, d\},\{b, d\},\{a, b, c\},\{a, c, d\},\{a, b, d\},\{b, c, d\}\}$
Here the inverse images of open sets $\{b\},\{a, b\},\{b, c, d\}$ in $(Y, \sigma)$ are $\{b\},\{b, c\},\{a, b, d\}$ respectively which are $b \hat{g}-$ closed but not closed in $(X, \tau)$. Hence $f$ is contra $b \hat{g}$ - continuous function but not contra continuous.

Theorem 3.6: Every contra g-continuous function is contra b $\hat{g}$ - continuous.
Proof: Let V be any open set in $(\mathrm{Y}, \sigma)$. Since f is contra g-continuous, $f^{-1}(\mathrm{~V})$ is g-closed in ( $\left.\mathrm{X}, \tau\right)$. From [3] Proposition 3.6, "Every g-closed set is b $\hat{g}-C l o s e d "$ ". Then $f^{-1}(\mathrm{~V})$ is $b \hat{g}-C l o s e d ~ i n ~(X, \tau)$. Hence $f$ is contra $b \hat{g}-$ continuous.

Remark 3.7: The converse of the above theorem need not be true.
(i.e) Every contra bg - continuous need not be contra g-continuous function as shown in the following example.

Example 3.8: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{X, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$

Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{a}, \mathrm{f}(\mathrm{d})=\mathrm{d}$.
$g-C(X)=\{X, \Phi,\{b\},\{c\},\{d\},\{b, c\},\{c, d\},\{b, d\},\{a, b, c\},\{a, c, d\},\{b, c, d\}\}$
$b \hat{g}-C(X)=\{X, \Phi,\{b\},\{c\},\{d\},\{b, c\},\{c, d\},\{b, d\},\{a, b, c\},\{a, c, d\},\{a, b, d\},\{b, c, d\}\}$
Here the inverse images of open set $\{b, c, d\}$ in $(Y, \sigma)$ is $\{a, b, d\}$ which is $b \hat{g}-$ closed but not $g$-closed in $(X, \tau)$. Hence $f$ is contra bĝ - continuous, but not contra g-continuous.

Theorem 3.9: Every contra b-continuous function is contra bg - continuous.
Proof: Let V be any open set in (Y, $\sigma$ ). Since f is contra b-continuous, $f^{-1}(\mathrm{~V})$ is b -closed in ( $\left.\mathrm{X}, \tau\right)$. Since from [3] Proposition 3.3, "Every b-closed set is b $\hat{g}-C l o s e d "$ ". Then $f^{-1}(\mathrm{~V})$ is $b \hat{g}-C l o s e d ~ i n ~(X, \tau)$. Hence $f$ is contra b $\hat{g}-$ continuous.

Remark 3.10: The converse of the above theorem need not be true.
(i.e) Every contra bg - continuous need not be contra b-continuous map as shown in the following example.

Example 3.11: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\}\}$
Define a function $\mathrm{f}(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{b}$.
$b \hat{g}-C(X)=\{X, \Phi,\{b\},\{c\},\{a, b\},\{a, c\},\{b, c\}\}$
$b-C(X)=\{X, \Phi,\{b\},\{c\},\{b, c\}\}$
Here the inverse image of an open set $\{a, c\}$ in $(Y, \sigma)$ is $\{a, b\}$ which is $b \hat{g}-c l o s e d$ but not $b-c l o s e d ~ i n ~(X, \tau)$. Hence $f$ is contra bĝ-continuous, but not contra b-continuous.

Theorem 3.12: Every contra $\alpha$-continuous function is contra $b \hat{g}-$ continuous.
Proof: Let V be any open set in (Y, $\sigma$ ). Since f is contra $\alpha$-continuous, $f^{-1}(\mathrm{~V})$ is $\alpha$-closed in (X, $\tau$ ). From [3] Remark 3.23 "Every $\alpha$-closed set is bg - Closed". Then $f^{-1}(\mathrm{~V})$ is b $\hat{g}$-Closed in $(\mathrm{X}, \tau)$. Hence f is contra b$\hat{g}$-continuous.

Remark 3.13: The converse of the above theorem need not be true.
(i.e) Every contra bĝ - continuous need not be contra $\alpha$-continuous function as shown in the following example.

Example 3.14: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{c}, \mathrm{f}(\mathrm{d})=\mathrm{d}$.
$\alpha-C(X)=\{X, \Phi,\{d\},\{a, d\},\{b, c, d\}\}$
$b \hat{g}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{d}\},\{\mathrm{b}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
Here the inverse images of open sets $\{a\},\{a, c\},\{a, b, d\}$ in $(Y, \sigma)$ are $\{b\},\{b, c\},\{a, b, d\}$ respectively which are $b \hat{g}$ closed but not $\alpha$-closed in (X, $\tau$ ). Hence f is contra $\mathrm{b} \hat{\mathrm{g}}$ - continuous, but not contra $\alpha$-continuous.

Theorem 3.15: Every contra semi-continuous function is contra b $\hat{g}-$ continuous.
Proof: Let V be any open set in (Y, $\sigma$ ). Since f is contra semi-continuous, $f^{-1}(\mathrm{~V})$ is semi-closed in (X, $\left.\tau\right)$. From [3] Remark 3.23 "Every semi-closed set is bg-Closed". Then $f^{-1}(\mathrm{~V})$ is b $\hat{\mathrm{g}}$-Closed in (X, $\tau$ ). Hence f is contra b $\hat{g}$-continuous.

Remark 3.16: The converse of the above theorem need not be true.
(i.e) Every contra bg - continuous need not be contra semi-continuous function as shown in the following example.

Example 3.17: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{c}, \mathrm{f}(\mathrm{d})=\mathrm{d}$.
semi-C $(X)=\{X, \Phi,\{a\},\{c\},\{d\},\{a, c\},\{a, d\},\{c, d\},\{a, c, d\}\}$
$b \hat{g}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{d}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$

Here the inverse image of an open set $\{a, b, d\}$ in $(Y, \sigma)$ is $\{a, b, d\}$ which is $b \hat{g}-$ closed but not semi-closed in (X, $\tau$ ). Hence $f$ is contra $b \hat{g}$ - continuous, but not contra semi-continuous.

Remark 3.18: From the above discussions and known results, we have the following diagram.

Remark 3.19: The Composition of two contra bg - continuous function need not be contra bg - continuous.
Example 3.20: Let $\mathrm{X}=\mathrm{Y}=\mathrm{Z}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}, \quad \sigma=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$ and $\eta=\{\mathrm{Z}, \Phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{a}, \mathrm{f}(\mathrm{d})=\mathrm{d}$ and $g:(Y, \sigma) \longrightarrow(Z, \eta)$ by $g(a)=a, g(b)=d, g(c)=c, g(d)=b$.

Clearly $f$ and $g$ are contra $b \hat{g}$ - continuous. But their composition is not contra $b \hat{g}$ - continuous function, since $(f o g)^{-1}$ of an open set $\{b, c\}$ in $(Z, \eta)$ is $\{a, d\}$ which is not $b \hat{g}-\operatorname{closed}$ in $(X, \tau)$. Hence fog is not contra bg-continuous.

Theorem 3.21: The following are equivalent for a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$
(a) $f$ is contra $b \hat{g}$ - continuous.
(b) For every closed subset F of $\mathrm{Y}, f^{-1}(\mathrm{~F})$ is $\mathrm{b} \hat{g}$-open in X .
(c) For each $x \varepsilon X$ and each closed subset $F$ of $Y$ with $f(x) \varepsilon F$, there exists a bg -open set $U$ of $X$ with $x \varepsilon U, f(U) \subseteq F$.

## Proof:

(a) $\rightleftarrows$ (b) Obviously follows from the definition.
(b) $\longleftrightarrow$ (c) Let F be any Closed subset of Y and let $\mathrm{f}(\mathrm{x}) \varepsilon \mathrm{F}$ where $\mathrm{x} \varepsilon X$. Then by (b), $f^{-1}(\mathrm{~F})$ is bg -open in X. Also $\mathrm{x} \varepsilon f^{-1}(\mathrm{~F})$. Take $\mathrm{U}=f^{-1}(\mathrm{~F})$. Then U is a bg -open set containing x and $\mathrm{f}(\mathrm{U}) \sqsubseteq \mathrm{F}$.
(c) $\Longleftrightarrow$ (b) Let F be any Closed subset of Y. If $\mathrm{x} \varepsilon f^{-1}(\mathrm{~F})$ then $\mathrm{f}(\mathrm{x}) \varepsilon \mathrm{F}$. By (c), there exists a bg -open set $U_{x}$ of X with $\mathrm{x} \varepsilon U_{x}$ such that $\mathrm{f}\left(U_{x}\right) \sqsubseteq \mathrm{F}$. Then $f^{-1}(\mathrm{~F})=\mathrm{U}\left\{U_{x}: \mathrm{x} \varepsilon f^{-1}(\mathrm{~F})\right\}$. Hence $f^{-1}(\mathrm{~F})$ is b $\hat{\mathrm{g}}$-open in X .

Theorem 3.22: If a function $f:(X, \tau) \longrightarrow(Y, \sigma)$ is contra $b \hat{g}$ - continuous and $X$ is $T b \hat{g}-s p a c e$, then $f$ is contra $b-$ continuous.

Proof: Let V be any open set in Y. Since f is contra $\mathrm{b} \hat{g}$ - continuous, $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{g}$-closed in X . Also since X is $\mathrm{Tb} \hat{g}-$ space, $f^{-1}(\mathrm{~V})$ is b -closed in X . Hence f is contra b - continuous.

Corollary 3.23: If X is $\mathrm{Tb} \hat{g}$-space, then for the function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$, the following statements are equivalent.
i) f is contra b - continuous.
ii) $f$ is contra b $\hat{g}$ - continuous.

## Proof:

(i) $\longleftrightarrow$ (ii) Let V be any open set in Y. Since f is contra b -continuous, $f^{-1}(\mathrm{~V})$ is b -closed in X . From [3] proposition 3.3, "Every b -closed is b $\hat{g}$-closed ". Therefore, $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{g}$-closed in X . Hence f is contra $\mathrm{b} \hat{g}$ - continuous.
(ii) $\rightleftarrows$ (i) Let V be any open set in Y. Since f is contra $\mathrm{b} \hat{g}-$ continuous, $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{\mathrm{g}}-$ closed in X . Since X is $\mathrm{Tb} \hat{\mathrm{g}}-$ space, $f^{-1}(\mathrm{~V})$ is b -closed in X . Hence f is contra b - continuous.

Theorem 3.24: Let $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ be a function, then the following statements are equivalent.

1. f is $\mathrm{b} \hat{\mathrm{g}}$ - continuous.
2. For each point $x \varepsilon X$ and each open set of $Y$ with $f(x) \varepsilon V$, there exists a bg -open set $U$ of $X$ such that $x \varepsilon U, f(U) \subseteq V$.

## Proof:

(i) $\Longrightarrow$ (ii) Let $\mathrm{f}(\mathrm{x}) \varepsilon \mathrm{V}$, then $\mathrm{x} \varepsilon f^{-1}(\mathrm{~V})$. Since f is $\mathrm{b} \hat{\mathrm{g}}$ - continuous, $f^{-1}(\mathrm{~V})$ is bg -open in X . Let $\mathrm{U}=f^{-1}(\mathrm{~V})$, then $x \varepsilon U$ and $f(U) \sqsubseteq V$.
(ii) $\rightleftarrows$ (i) Let V be any open set in Y and $\mathrm{x} \varepsilon f^{-1}(\mathrm{~V})$, then $\mathrm{f}(\mathrm{x}) \varepsilon \mathrm{V}$. From (ii), there exists a bg- open set $U_{x}$ of X such that $\mathrm{x} \varepsilon U_{x} \sqsubseteq f^{-1}(\mathrm{~V})$ and $f^{-1}(\mathrm{~V})=\cup\left\{U_{x}\right\}$. Then $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{\mathrm{g}}$-open in X. Hence f is $\mathrm{b} \hat{\mathrm{g}}-$ continuous.

Theorem 3.25: If a function $f:(X, \tau) \longrightarrow(Y, \sigma)$ is contra $b \hat{g}$ - continuous and $Y$ is regular, then $f$ is $b \hat{g}-$ continuous.
Proof: Let $x \varepsilon X$ and $V$ be an open set in $Y$ with $f(x) \varepsilon V$. Since $Y$ is regular, there exists an open set $W$ in $Y$ such that $\mathrm{f}(\mathrm{x}) \varepsilon \mathrm{W}$ and $\mathrm{Cl}(\mathrm{W}) \subseteq \mathrm{C}$. Since f is contra $\mathrm{b} \hat{g}$ - continuous and $\mathrm{Cl}(\mathrm{W})$ is a closed subset of Y with $\mathrm{f}(\mathrm{x}) \varepsilon \mathrm{Cl}(\mathrm{W})$. By theorem 3.21, there exists a bg -open set $U$ of $X$ with $x \varepsilon U$ such that $f(U) \sqsubseteq C l(W)$. That is $f(U) \subseteq V$. By theorem 3.24, $f$ is bg - continuous.

Definition 3.26: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is said to be strongly bg -continuous if $f^{-1}(\mathrm{~V})$ is closed in $(\mathrm{X}, \tau)$ for every bg -closed set V in (Y, $\sigma$ ).

Definition 3.27: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is said to be perfectly $\mathrm{bg}-$ continuous if $f^{-1}(\mathrm{~V})$ is clopen in $(\mathrm{X}, \tau)$ for every bg -closed set V in $(\mathrm{Y}, \sigma)$.

Definition 3.28: A topological space ( $\mathrm{X}, \tau$ ) is said to be bg -Hausdorff if for each pair of distinct points x and y in X , there exists $b \hat{g}$-open subsets $U$ and $V$ of $X$ containing $x$ and $y$ respectively such that $U \cap V=\emptyset$.

Definition 3.29: A topological space $(\mathrm{X}, \tau)$ is said to be $\mathrm{b} \hat{\mathrm{g}}$-ultra Hausdorff if for each pair of distinct points x and y in X , there exists bg -clopen subsets U and V of X containing x and y respectively such that $U \cap V=\emptyset$.

Definition 3.30: A space ( $\mathrm{X}, \tau$ ) is said to be locally indiscrete if every open subset of X is closed.
Definition 3.31: A Topological space ( $\mathrm{X}, \tau$ ) is said to be $b \hat{g}$-connected if $X$ cannot be written as the disjoint union of nonempty bg -open sets.

Definition 3.32: A Topological space $(\mathrm{X}, \tau)$ is said to be Urysohn space if for each pair of distinct points x and y in X , there exists two open sets U and V in X such that $\mathrm{x} \varepsilon \mathrm{U}, \mathrm{y} \varepsilon \mathrm{V}$ and $\operatorname{cl}(U) \cap c l(V)=\varnothing$.

Definition 3.33: A Topological space ( $\mathrm{X}, \tau$ ) is said to be $\mathrm{Tb} \hat{\mathrm{g}}^{*}$-space if every bg -closed set in it is closed.
Example 3.34: Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{X, \Phi,\{a\},\{b\},\{a, b\},\{a, c\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
$C(X)=\{X, \Phi,\{b\},\{c\},\{a, c\},\{b, c\}\}$
Clearly X is $\mathrm{Tb} \hat{\mathrm{g}}^{*}$-space.
Theorem 3.35: Let $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ be surjective, closed and contra $\mathrm{b} \hat{\mathrm{g}}$-continuous. If X is $\mathrm{Tb}^{*}{ }^{*}-$ space, then Y is locally indiscrete.

Proof: Let V be any open set in $(\mathrm{Y}, \sigma)$. Since f is contra $\mathrm{b} \hat{\mathrm{g}}$-continuous, $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{g}$-closed in $(\mathrm{X}, \tau)$. Also since X is $\mathrm{Tb} \hat{\mathrm{g}}^{*}$-space, $f^{-1}(\mathrm{~V})$ is closed in $(\mathrm{X}, \tau)$. By hypothesis, f is closed and surjective, $f\left(f^{-1}(\mathrm{~V})\right)=\mathrm{V}$ is closed in Y. Hence Y is locally indiscrete.

Theorem 3.36: If a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is continuous and $(\mathrm{X}, \tau)$ is locally indiscrete space, then f is contra bg - continuous.

Proof: Let V be any open set in $(\mathrm{Y}, \sigma)$. Since f is continuous, $f^{-1}(\mathrm{~V})$ is open in $(\mathrm{X}, \tau)$. Since X is locally indiscrete, $f^{-1}(\mathrm{~V})$ is closed in $(\mathrm{X}, \tau)$. Now from [3] Remark 3.23, $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{g}$-closed in X . Hence f is contra bg -continuous.

Theorem 3.37: If a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is contra $b \hat{g}$-continuous, injective and Y is $\mathrm{b} \hat{\mathrm{g}}$-ultra Hausdorff, then the topological space $X$ is $b \hat{g}$ - Hausdorff.

Proof: Let $x_{1}$ and $x_{2}$ be two distinct points of X . Since f is injective, $f\left(x_{1}\right) \neq f\left(x_{2}\right)$ and since Y is $\mathrm{b} \hat{\mathrm{g}}$-ultra Hausdorff, there exists bg -clopen sets U and V in Y such that $f\left(x_{1}\right) \varepsilon U$ and $f\left(x_{2}\right) \varepsilon V$ where $U \cap V=\emptyset$.Also $x_{1} \varepsilon f^{-1}(U)$ and $x_{2} \varepsilon f^{-1}(V)$ where $f^{-1}(U) \cap f^{-1}(V)=\emptyset$. Hence X is $\mathrm{b} \hat{\mathrm{g}}-$ Hausdorff.

Theorem 3.38: If a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is strongly $b \hat{g}$-continuous function and $\mathrm{g}:(\mathrm{Y}, \sigma) \longrightarrow(\mathrm{Z}, \eta)$ is contra $\mathrm{b} \hat{\mathrm{g}}$-continuous function then $g o f:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Z}, \eta)$ is contra continuous.

Proof: Let $V$ be any open set in $(Z, \eta)$. Since $g$ is contra $b \hat{g}$-continuous, then $g^{-1}(V)$ is $b \hat{g}-$ closed in $(\mathrm{Y}, \sigma)$. Since f is strongly b $\hat{g}$-continuous, then $f^{-1}\left(g^{-1}(V)\right)=(g \circ f)^{-1}(V)$ is closed in $(\mathrm{X}, \tau)$. Hence $g o f$ is contra continuous.

Theorem 3.39: If a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is contra bg -continuous, injective and Y is Urysohn space, then the topological space $X$ is $b \hat{g}$ - Hausdorff.

Proof: Let $x_{1}$ and $x_{2}$ be two distinct points of X . Suppose $y_{1}=f\left(x_{1}\right)$ and $y_{2}=f\left(x_{2}\right)$.Since f is injective, $x_{1} \neq x_{2}$ then $y_{1} \neq y_{2}$. Since Y is Urysohn, there exists open sets $V_{1}$ and $V_{2}$ containing $y_{1}$ and $y_{2}$ respectively in Y such that $\operatorname{Cl}\left(V_{1}\right) \cap$ $C l\left(V_{2}\right)=\emptyset$. Since f is contra b $\hat{\mathrm{g}}$-continuous, by theorem 3.21 there exists b $\hat{\mathrm{g}}$-open sets $U_{1}$ and $U_{2}$ containing $x_{1}$ and $x_{2}$ respectively in X such that $\mathrm{f}\left(U_{1}\right) \subseteq \mathrm{Cl}\left(V_{1}\right)$ and $\mathrm{f}\left(U_{2}\right) \subseteq \mathrm{Cl}\left(V_{2}\right)$. Since $\operatorname{Cl}\left(V_{1}\right) \cap \operatorname{Cl}\left(V_{2}\right)=\emptyset$, then $U_{1} \cap U_{2}=\emptyset$. Hence X is $\mathrm{b} \hat{\mathrm{g}}$ - Hausdorff.

Theorem 3.40: Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a function and $\mathrm{g}: \mathrm{X} \rightarrow \mathrm{XxY}$ be a graph function defined by $g(x)=(x, f(x))$ for every $x \in X$. If $g$ is contra $b \hat{g}$-continuous, then $f$ is contra $b \hat{g}$ - continuous.

Proof: Let $V$ be a closed subset of $Y$. Then $\mathrm{X} x \mathrm{~V}$ is a closed subset of XxY . Since g is contra $\mathrm{b} \hat{g}$-continuous, $g^{-1}(X \mathrm{x} V)$ is $\mathrm{b} \hat{\mathrm{g}}$-open subset of X . Also $g^{-1}(X \mathrm{x} V)=f^{-1}(V)$. Hence f is contra $\mathrm{b} \hat{\mathrm{g}}$ - continuous.

## 4. Contra bĝ - Irresolute

Definition 4.1: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is called contra $\mathrm{b} \hat{\mathrm{g}}$-irresolute if $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{\mathrm{g}}$-closed in $(\mathrm{X}, \tau)$ for every $\mathrm{b} \hat{\mathrm{g}}-$ open set V in $(\mathrm{Y}, \sigma)$.

Example 4.2: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{d}, \mathrm{f}(\mathrm{d})=\mathrm{b}$.
$b \hat{g}-C(X)=\{X, \Phi,\{a\},\{b\},\{c\},\{d\},\{b, c\},\{c, d\},\{b, d\},\{a, d\},\{a, c, d\},\{a, b, d\},\{b, c, d\}\}$
$\mathrm{b} \hat{g}^{-} \mathrm{O}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
Clearly f is contra $\mathrm{b} \hat{\mathrm{g}}$ - irresolute.
Remark 4.3: The following example show that the concepts of b $\hat{g}$ - irresolute and contra $b \hat{g}$-irresolute are independent of each other.

Example 4.4: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$

Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{d}, \mathrm{f}(\mathrm{d})=\mathrm{b}$.
$b \hat{g}-C(X)=\{X, \Phi,\{a\},\{b\},\{c\},\{d\},\{b, c\},\{c, d\},\{b, d\},\{a, d\},\{a, c, d\},\{a, b, d\},\{b, c, d\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{O}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
Clearly $f$ is contra $b \hat{g}$ - irresolute, but not bê-irresolute. Since the inverse images of $b \hat{g}-$ closed sets $\{c, d\},\{a, c\},\{a, c, d\}$ in $(Y, \sigma)$ are $\{a, c\},\{a, b\},\{a, b, c\}$ respectively which are not $b \hat{g}-$ closed in $(X, \tau)$.

Example 4.5: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{c}$.
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
Clearly f is $\mathrm{b} \hat{\mathrm{g}}$ - irresolute, but not contra b $\hat{g}$ - irresolute. Since the inverse images of $\mathrm{b} \hat{\mathrm{g}}$ - closed sets $\{\mathrm{a}\}$ and $\{\mathrm{a}, \mathrm{b}\}$ in $(\mathrm{Y}, \sigma)$ are $\{\mathrm{a}\}$ and $\{\mathrm{a}, \mathrm{b}\}$ respectively which are not $\mathrm{b} \hat{g}-\operatorname{closed}$ in $(\mathrm{X}, \tau)$.

Theorem 4.6: Every contra bg -irresolute function is contra bg - continuous.
Proof: Let V be any open set in (Y, $\sigma$ ). From [3] Remark 3.23, V is also bg $\hat{\mathrm{g}}$-open in $(\mathrm{Y}, \sigma$ ). Since f is contra bg irresolute, $f^{-1}(\mathrm{~V})$ is $\mathrm{b} \hat{\mathrm{g}}-\mathrm{Closed}$ in $(\mathrm{X}, \tau)$. Hence f is contra $\mathrm{b} \hat{\mathrm{g}}$-continuous.

Remark 4.7: The converse of the above theorem need not be true.
(i.e) Every contra bg - continuous function need not be contra bg -irresolute as shown in the following example.

Example 4.8: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}, \mathrm{b}\},\{\mathrm{c}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{b}$.
$b \hat{g}-C(X)=\{X, \Phi,\{a\},\{b\},\{c\},\{a, c\},\{b, c\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{O}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
Clearly f is contra bg -continuous but not contra b $\hat{g}$-irresolute. Since the inverse image of a b $\hat{g}$-open set $\{\mathrm{a}, \mathrm{c}\}$ in $(\mathrm{Y}, \sigma)$ is $\{a, b\}$ which is not $b \hat{g}$-closed in (X, $\tau$ ).

Remark 4.9: The following example show that the concepts of $b \hat{g}-$ continuous and contra $b \hat{g}$-continuuous are independent of each other.

Example 4.10: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{c}, \mathrm{f}(\mathrm{d})=\mathrm{d}$.
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
Clearly $f$ is contra $b \hat{g}$ - continuous, but not $b \hat{g}$ - continuous. Since the inverse images of closed sets $\{b, d\}$ and $\{b, c, d\}$ in $(Y, \sigma)$ are $\{b, d\}$ and $\{b, c, d\}$ respectively which are not $b \hat{g}-\operatorname{closed}$ in $(X, \tau)$.

Example 4.11: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{d}, \mathrm{f}(\mathrm{d})=\mathrm{c}$.
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
Clearly $f$ is $b \hat{g}$ - continuous, but not contra $b \hat{g}$ - continuous. Since the inverse images of open sets $\{a\}$ and $\{a, c\}$ in ( $Y, \sigma$ ) are $\{b\}$ and $\{b, d\}$ respectively which are not $b \hat{g}$ - closed in (X, $\tau$ ).

Theorem 4.12: If a function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is contra $\mathrm{b} \hat{\mathrm{g}}$-irresolute function and $\mathrm{g}:(\mathrm{Y}, \sigma) \longrightarrow(\mathrm{Z}, \eta)$ is $b \hat{g}$-irresolute function then $g o f:(\mathrm{X}, \tau) \rightarrow(\mathrm{Z}, \eta)$ is contra $\mathrm{b} \hat{\mathrm{g}}$-irresolute.

Proof: Let $V$ be any b $\hat{g}$-open set in $(Z, \eta)$. Since $g$ is $b \hat{g}$-irresolute, then $g^{-1}(V)$ is $b \hat{g}$-open in $(Y, \sigma)$. Since $f$ is contra b $\hat{g}$-irresolute, then $f^{-1}\left(g^{-1}(V)\right)=(g o f)^{-1}(V)$ is also b $\hat{g}$-closed in $(X, \tau)$. Hence $g o f$ is contra $b \hat{g}$-irresolute.

Theorem 4.13: If a function $f:(X, \tau) \longrightarrow(Y, \sigma)$ is contra $b \hat{g}$-irresolute function and $g:(Y, \sigma) \longrightarrow(Z, \eta)$ is $b \hat{g}-$ continuous then gof: $(\mathrm{X}, \tau) \longrightarrow(\mathrm{Z}, \eta)$ is contra b $\hat{g}$-continuous.

Proof: Let V be any open set in $(\mathrm{Z}, \eta)$. Since g is $\mathrm{b} \hat{\mathrm{g}}$ - continuous, then $g^{-1}(V)$ is $b \hat{g}$-open in $(\mathrm{Y}, \sigma)$. Since f is contra $\mathrm{bg}-$ irresolute, then $f^{-1}\left(g^{-1}(V)\right)=(g \circ f)^{-1}(V)$ is b $\hat{g}$-closed in $(\mathrm{X}, \tau)$. Hence $g o f$ is contra $\mathrm{b} \hat{\mathrm{g}}$ - continuous.

## 5. Perfectly Contra bg - Irresolute

Definition 5.1: A function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ is called perfecty contra $\mathrm{b} \hat{g}$-irresolute if $f^{-1}(\mathrm{~V})$ is b$\hat{g}-$ clopen in $(\mathrm{X}, \tau)$ for every bg -open set V in (Y, $\sigma$ ).

Example 5.2: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}, \mathrm{c}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{c}$.
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{O}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
$b \hat{g}-C(X)=\{X, \Phi,\{a\},\{b\},\{c\},\{a, b\},\{a, c\},\{b, c\}\}$
$b \hat{g}-\mathrm{O}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
Clearly f is perfecty contra $\mathrm{b} \hat{g}$-irresolute, since the inverse images of all b$\hat{g}-$ open sets in Y are $\mathrm{b} \hat{\mathrm{g}}$-clopen in X .
Theorem 5.3: Every perfecty contra bg -irresolute map is contra b $\hat{g}$-irresolute
Proof: It directly follows from the definition.
Remark 5.4: The converse of the above theorem need not be true.
(i.e) Every contra bg - irresolute map need not be perfecty contra b $\hat{g}$-irresolute map as shown in the following example.

Example 5.5: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{a}, \mathrm{c}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{c}$.
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{O}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\}\}$
$b \hat{g}-C(X)=\{X, \Phi,\{b\},\{c\},\{a, b\},\{a, c\},\{b, c\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{O}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{b}, \mathrm{c}\}\}$
Clearly f is contra bg -irresolute but not perfecty contra bg -irresolute. Since the inverse image of bê-open set $\{a, c\}$ in $Y$ is $\{b, c\}$ which is not $b \hat{g}$-clopen in $X$.

Theorem 5.6: Every perfecty contra bg -irresolute map is bg -irresolute
Proof: It directly follows from the definition.
Remark 5.7: The converse of the above theorem need not be true.
(i.e) Every bg - irresolute map need not be perfecty contra bg -irresolute map as shown in the following example.

Example 5.8: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$
$\tau=\{\mathrm{X}, \Phi,\{\mathrm{a}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$ and $\sigma=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
Define a function $\mathrm{f}:(\mathrm{X}, \tau) \longrightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{c}, \mathrm{f}(\mathrm{d})=\mathrm{d}$.
$b \hat{g}-\mathrm{O}(\mathrm{X})=\{X, \Phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{a}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{C}(\mathrm{X})=\{\mathrm{X}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{b}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}\}$
$\mathrm{b} \hat{\mathrm{g}}-\mathrm{O}(\mathrm{Y})=\{\mathrm{Y}, \Phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{b}, \mathrm{d}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{d}\}\}$

Clearly f is $\mathrm{b} \hat{\mathrm{g}}$-irresolute, but not perfectly contra $\mathrm{b} \hat{\mathrm{g}}$-irresolute. Since the inverse images of $\mathrm{b} \hat{\mathrm{g}}-\mathrm{open}$ sets $\{b\},\{a, b\}$, $\{b, c\}$ and $\{b, d\}$ in $Y$ are $\{a\},\{a, b\},\{a, c\}$ and $\{a, d\}$ respectively which are not $b \hat{g}-$ clopen in $(X, \tau)$.

Remark 5.9: From the above discussions and known results, we have the following diagram.

In this diagram, $A \longrightarrow B$ means $A$ implies $B$ but not conversely. $A \longleftrightarrow B$ means $A$ and $B$ are independent of each other.
