#### Abstract

$\boldsymbol{A}_{(V, E)}$ graph $G$ is reverse edge-magic if there exists a bijection $f: V \cup E \rightarrow\{1,2,3, \ldots \ldots \ldots, v+\varepsilon\}$ such that $\forall e=(u, v) \in$ $E, f(e)-\{f(u)+f(v)\}=$ constant. A reverse edge- magic graph is a reverse super edge- magic if $f(V(G))=\{1,2,3,--$ - $V\}$ and $f(E(G))=\{V+1, V+2, V+3, \ldots \ldots \ldots V+\varepsilon\}$. For $n \geq 2$, let $a_{1}, a_{2}, a_{3}, \ldots \ldots . ., a_{n}$ be a sequence of increasing non-negative integers. A n- star $\operatorname{St}\left(a_{1}, a_{2}, a_{3}, \ldots \ldots \ldots, a_{n}\right)$ is a disjoint union of $n$-stars $\operatorname{St}\left(a_{1}\right), \operatorname{St}\left(a_{2}\right)$ $\ldots \ldots ., S t\left(a_{n}\right)$. In this paper , we investigate several classes of $n$-stars that are reverse super edge-magic.

## 1. INTRODUCTION

In this paper, we consider graphs with no loops or multiple edges. For undefined concepts we refer the reader to [1]. A $(\mathrm{V}, \mathrm{E})$ - graph G is with $v$ vertices and $\varepsilon$ edges is called reverse edge- magic if there is a bijection $\mathrm{f}: V \cup E \rightarrow\{1,2,3$, $\mathrm{v}+\varepsilon\}$ such that $\mathrm{f}(\mathrm{e})-\{\mathrm{f}(\mathrm{u})+\mathrm{f}(\mathrm{v})\}=$ constant. A reverse edge- magic graph is a reverse super edge- magic graph if $f(V(G))=\{1,2,3, \ldots \ldots v\}$ and $f(E(G))=\{v+1, v+2, v+3 \ldots \ldots . . v+\varepsilon\}$. This concept of reverse super edge-magic graphs was introduced by Venkata Ramana et al. in 2007 [4]. An example of unicyclic graph with 6 vertices and its reverse super edge-magic labeling is shown in Fig 1.

FIG-1

The original concept of reverse super edge-magic graph is due to Venkata ramana et.al [4]. They called it reverse super edge-magic graph. They proved the following results:
(1). If a non trivial graph $G$ is reverse super edge-magic, then $|E(G)| \leq 2|V(G)|-3$
(2). A cycle Cn is reverse super edge-magic if and only if n is odd.
(3). A complete bipartite graph $K m, n$ is reverse super edge-magic if and only if $m=1$ or $n=1$.
(4). The fan $f_{n}=P_{n}+K_{1}$ is reverse super edge-magic if and only if $1 \leq n \leq 6$.
(5). The ladder $L_{n} \cong P_{n} \times P_{2}$ is reverse super edge-magic where n is odd.
(6). The generalized prism $\mathrm{Cm} \times \mathrm{Pn}$ is reverse super edge-magic if m is odd and $n \geq 2$
(7). Let $G=(n, 2)$-kite. The graph $G$ is reverse super edge-magic if and only if $n$ is even.
(8). Let $\mathrm{G}=K_{2} \mathrm{U} C_{n}$. The graph G is reverse super edge-magic if n is even $(n \neq 10)$.

For $n \geq 2$, let $a_{1}, a_{2}, a_{3}, \ldots \ldots \ldots, a_{n}$ be a sequence of increasing non-negative integers. We will use $\operatorname{St}\left(a_{1}, a_{2}, a_{3}, \ldots \ldots \ldots\right.$, $a_{n}$ ) to denote a $n$-Star, which is a disjoint union of $n$-stars $K\left(1, a_{1}\right), K\left(1, a_{2}\right), \ldots \ldots \ldots, K\left(1, a_{n}\right)$. The $\operatorname{graph} \operatorname{St}\left(a_{1}, a_{2}, a_{3}\right.$, , $a_{n}$ ) is shown in Figure 2.

## 2. REVERSE SUPER EDGE-MAGIC 2-STARS

By applying the result of Venkata Ramana et al. several classes of $n$-stars are shown to be reverse super edge-magic.
Theorem 1: The 2-star $\operatorname{St}(\mathrm{n}, \mathrm{n}+1)$ is reverse super edge-magic for all $n \geq 1$.
Proof: We will give two different reverse super edge-magic labelings for $\operatorname{St}(\mathrm{n}, \mathrm{n}+1)$.
Method 1: We label the vertices by

$$
\begin{array}{ll}
\mathrm{f}\left(\mathrm{x}_{1, \mathrm{j}}\right)=3+2 \mathrm{j}, \quad 1 \leq \mathrm{j} \leq \mathrm{n}, & \mathrm{f}\left(\mathrm{c}_{1}\right)=1 \\
\mathrm{f}\left(\mathrm{x}_{2, \mathrm{j}}\right)=2 \mathrm{j}, & 1 \leq \mathrm{j} \leq \mathrm{n}+1,
\end{array} \mathrm{f}\left(\mathrm{c}_{2}\right)=3 .
$$

Then we see that the edges in $K(1, n)$ has labels $\{2 n+5,2 n+7, \ldots, 4 n+3\}$ and the edges in $K(1, n+1)$ has labels $\{2 n+4,2 n+6, \ldots \ldots, 4 n+4\}$.Thus $\operatorname{St}(n, n+1)$ is reverse super edge-magic with reverse edge-magic number $2 n-1$.

Method-2: We label the vertices by

$$
\begin{array}{ll}
g\left(x_{1, j}\right)=2 \mathrm{j}-1, \quad 1 \leq \mathrm{j} \leq \mathrm{n}, & g\left(\mathrm{c}_{1}\right)=2 \mathrm{n}+3 \\
\mathrm{~g}\left(\mathrm{x}_{2, \mathrm{j}}\right)=2 \mathrm{j}, & 1 \leq \mathrm{j} \leq \mathrm{n}+1,
\end{array}
$$

Then we see that the edges in $K(1, n)$ has labels $\{2 n+5,2 n+7, \ldots, 4 n+3\}$ and the edges in $K(1, n+1)$ has labels $\{2 n+4,2 n+6, \ldots \ldots, 4 n+4\}$.Thus $\operatorname{St}(\mathrm{n}, \mathrm{n}+1)$ is reverse super edge-magic with reverse edge-magic number 1 .

Example 1: Reverse super edge - magic labelings for 2 -stars $\operatorname{St}(1,2), \operatorname{St}(2,3)$ and $\operatorname{St}(3,4)$ using the above two different methods.

FIG-2
Theorem 2: The 2-star $\operatorname{St}(\mathrm{m}, \mathrm{n})$ is reverse super edge-magic for all $n \equiv 0(\bmod m+1)$.
Proof: Assume $n=(m+1) k$. The 2 - star $S t(m,(m+1) k)$ has $(m+1)(k+1)+1$ vertices. We define a labeling $\mathrm{f}: \mathrm{V}(\mathrm{St}(\mathrm{m} .(\mathrm{m}+1) \mathrm{k})) \rightarrow\{1,2,3, \ldots .(\mathrm{m}+1)(\mathrm{k}+1)+1\}$ as follows.
$f\left(c_{1}\right)=(m+1)(k+1)+1 \quad f\left(c_{2}\right)=(m+1)(k+1)-k$
$\mathrm{f}\left(\mathrm{x}_{1, \mathrm{j}}\right)=1+(\mathrm{j}-1)(\mathrm{k}+1), 1 \leq \mathrm{j} \leq \mathrm{m}$.
$\mathrm{f}(\mathrm{x} 2, \mathrm{i})=1+\mathrm{i}, 1 \leq i \leq k ;$
$\mathrm{f}(\mathrm{x} 2, \mathrm{i})=\mathrm{i}+2, k+1 \leq i \leq 2 k$.
Hence $f^{+}(E(S t(1,2 k))=\{k+5, k+6, k+7$, $\qquad$ .,2k+6\}.

Corollary 1: The 2-Star $\operatorname{St}(1, \mathrm{n})$ is reverse super edge-magic if n is even.
Example 2: A reverse super edge-magic labeling of the 2-star $\operatorname{St}(1, \mathrm{n})$.

## S. Sharief Basha* and E. Kartheek** ON REVERSE SUPER EDGE-MAGIC n-STARS / IJMA- 6(1), Jan.-2015.

Corollary 2: The 2-Star $\operatorname{St}(2, \mathrm{n})$ is reverse super edge-magic if n is a multiple of 3 .
Example 3: Reverse super edge-magic labeling for 2 -star $\mathrm{St}(2, \mathrm{n})$, where $\mathrm{n}=3,6$.

FIG-4

## 3. REVERSE SUPER EDGE-MAGIC 3-STARS

Theorem 3: The 3-star $\operatorname{St}(1,1, \mathrm{n})$ is reverse super edge-magic for all $\mathrm{n} \geq 1$.
Proof: A reverse super edge-magic labeling of $\operatorname{St}(1,1, \mathrm{n})$ is given as follows: Define $\mathrm{f}: \mathrm{V}(\mathrm{St}(1,1, \mathrm{n})) \rightarrow\{1,2,3, \ldots, \mathrm{n}+5\}$ as follows:
$f(c 1)=1, f(c 2)=3 ; f(c 3)=2$
$f(x 1,1)=5 ; f(x 2,1)=4 ; f(x 3, i)=5+i, 1 \leq i \leq n$.
It can be easily verified that f induces a reverse super edge-magic labeling.
Example 4: A reverse super edge-magic labeling for 3-star $\operatorname{St}(1,1,6)$.

Theorem 4: The 3-star St (1, 2, n) is reverse super edge-magic for all $n \geq 2$.
Proof: A reverse super edge-magic labeling of $\operatorname{St}(1,2, \mathrm{n})$ is given in figure 6.

Theorem 5: The 3-star $\operatorname{St}(1, n, n)$ is reverse super edge-magic for all $n \geq 1$.
Proof: A reverse super edge-magic labeling of $\operatorname{St}(1,2, \mathrm{n})$ is given in figure 7.

FIG-7

Theorem 6: The 3-star $\operatorname{St}(2,2, \mathrm{n})$ is reverse super edge-magic for all $\mathrm{n} \geq 2$.
Proof: A reverse super edge-magic labeling of $\operatorname{St}(2,2, \mathrm{n})$ is given in figure 8.
For $n=2$

FIG- 8
Theorem 7: The 3-star $\operatorname{St}(2,3, \mathrm{n})$ is reverse super edge-magic for all $\mathrm{n} \geq 3$.
Proof: A reverse super edge-magic labeling of $\operatorname{St}(2,3, \mathrm{n})$ is given in figure 9.

## 4. REVERSE SUPER EDGE-MAGIC 4-STARS

Theorem 8: The 4-star $\operatorname{St}(1,1,2, n)$ is reverse super edge-magic for all $n \geq 2$.
Proof: A reverse super edge-magic labeling for $\operatorname{St}(1,1,2, n)$ for $\mathrm{n} \geq 2$ is shown in figure 10 .

Theorem 9: The 4-star $\operatorname{St}(1,1,3, n)$ is reverse super edge-magic for all $n \geq 3$.
Proof: A reverse super edge-magic labeling for $\operatorname{St}(1,1,3, n)$ for $n \square 3$ is shown in figure 11 .

Theorem 10: The 4-star $\operatorname{St}(1,2,2, n)$ is reverse super edge-magic for all $n \geq 2$.
Proof: A reverse super edge-magic labeling for $\operatorname{St}(1,2,2, n)$ for $n \geq 2$ is shown in Figure12

Theorem 11: The 4-star $\operatorname{St}(2,2,2, n)$ is reverse super edge-magic for all $n \geq 2$
Proof: A reverse super edge magic labeling for $\operatorname{St}(2,2,2, n)$ for $n \geq 2$ is shown in figure 13 .

We propose the following

## CONJECTURE

Given any odd integer $\mathrm{n} \geq 2$. Let $a_{1}, a_{2}, a_{3}, \ldots \ldots, a_{n}$ be a sequence of increasing non-negative integers. The n -star $\operatorname{St}\left(a_{1}, a_{2}, a_{3}, \cdots \ldots, a_{n}\right)$ is reverse super edge-magic.
